PART I

Book I of the treatise of Pappus on the rational and irrational continuous quantities, which are discussed in the tenth book of Euclid's treatise on the Elements: translated by Abū ʿUthmān Al-Dimishqī.

§ 1. The aim of Book X of Euclid's treatise on the Elements is to investigate the commensurable and incommensurable, the rational and irrational continuous quantities. This science (or knowledge) had its origin in the sect (or school) of Pythagoras, but underwent an important development at the hands of the Athenian, Theaetetus, who had a natural aptitude for this as for other branches of mathematics most worthy of admiration. One of the most happily endowed of men, he patiently pursued the investigation of the truth contained in these [branches of] science (or knowledge), as Plato bears witness for him in the book which he called after him, and was in my opinion the chief means of establishing exact distinctions and irrefragable proofs with respect to the above-mentioned quantities. For although later the great Apollonius whose genius for mathematics was of the highest possible order, added some remarkable species of these after much laborious application, it was nevertheless Theaetetus who distinguished the *powers* (i. e. the squares)[1] which are commensurable in length, from those which are incommensurable (i. e. in length), and who divided the more generally known irrational lines according to the different means, assigning the medial line to geometry, the binomial to arithmetic, and the apotome to harmony[2], as is stated by Eudemus, the Peripatetic[3]. Euclid's object, on the other hand, was the attainment of irrefragable principles, which he established for commensurability and incommensurability in general. For rationals and irrationals he formulated definitions and (specific) differences; determined also many orders of the irrationals; and brought to light, finally, whatever of finitude (or definiteness) is to be found in them[4]. Apollonius explained the species of the ordered irrationals and discovered the science of the so-called unordered, of which he produced an exceedingly large number by exact methods.

§ 2. Since this treatise (i. e. Book X of Euclid.) has the aforesaid aim and object, it will not be unprofitable for us to consolidate the good which it contains. Indeed the sect (or school) of Pythagoras was so affected by its reverence for these things that a saying became current in it, namely, that he who first disclosed the knowledge of surds or irrationals and spread it abroad among the common herd, perished by drowning: which is most probably a parable by which they sought to express their conviction that firstly, it is better to conceal (or veil) every surd, or irrational, or inconceivable[5] in the universe, and, secondly, that the soul which by error or heedlessness discovers or reveals anything of this nature which is in it or in this world, wanders [thereafter] hither and thither on the sea of non-identity (i. e. lacking all similarity of quality or accident)[6], immersed in the stream of the coming-to-be and the passing-away[7], where there is no standard of measurement. This was the consideration which Pythagoreans and the Athenian Stranger[8] held to be an incentive to particular care and concern for these things and to imply of necessity the grossest foolishness in him who imagined these things to be of no account.

§ 3. Such being the case, he of us who has resolved to banish from his soul such a disgrace as this, will assuredly seek to learn from Plato, the distinguisher of accidents[9], those things that
Page 3. merit shame[10], and to grasp those propositions which we have endeavoured to explain, and to examine carefully the wonderful clarity with which Euclid has investigated each of the ideas (or definitions)[11] of this treatise (i. e. Book X.). For that which

we here seek to expound, is recognised as the property which belongs essentially to geometry[12], neither the incommensurable nor the irrational being found with the numbers, which are, on the contrary, all rational and commensurable; whereas they are conceivable in the case of the continuous quantities, the investigation of which pertains to geometry. The reason for this is that the numbers, progressing by degrees, advance by addition from that which is a minimum, and proceed to infinity (or indefinitely); whereas the continuous quantities begin with a definite (or determined) whole and are divisible (or subject to division) to infinity (or indefinitely)[13]. If, therefore, a minimum cannot be found in the case of the continuous quantities, it is evident that there is no measure (or magnitude) which is common to all of them, as unity is common to the numbers. But it is self-evident that they (i. e. the continuous quantities) have no minimum; and if they do not have a minimum, it is impossible that all of them should be commensurable. If, then, the reason be demanded why a minimum but not a maximum is found in the case of a discrete quantity, whereas in the case of a continuous quantity a maximum but not a minimum is found, you should reply that such things as these are distinguished from one-another only by reason of their homogeneity with the finite or the infinite, some of those created things which are contraries of one-another, being finite, whereas the others proceed from infinity. Compare, for example, the contraries, like and unlike, equal and unequal, rest and movement. [Like, equal, and rest, promote (or make for)[14]] finitude; whereas unlike, unequal, and movement promote (or make for) infinity. And such is the case generally. Unity and plurality, the whole and the parts are similarly constituted. One and the whole clearly belong to the sphere of the finite, whereas the parts and plurality belong to the sphere of the infinite. Consequently one is that which is determined and defined in the case of the numbers, since such is the nature of unity, and plurality is infinite (or indefinite); whereas Page 4.

the whole is that which is determined in the case of the continuous quantities, and division into parts is, as is evident, infinite (or indefinite). Thus in the case of the numbers one is the contrary of plurality, since although number is comprised in plurality as a thing in its genus, unity which is the principle of number, consists either in its being one or in its being the first thing with the name of one. In the case of the continuous quantities, on the other hand, the contrary of whole is part, the term, whole, being applicable to continuous things only, just as the term, total, is applicable only to discrete things[15]. These things, then, are constituted in the manner which we have described.

§ 4. We should also examine the [logical] arrangement of ideas in Euclid's propositions: how he begins with that which is necessarily the beginning, proceeds, then, comprehensively and consistently, with what is intermediate, to reach, finally, without fail the goal of an exact method. Thus in the first proposition of this treatise (i. e. Book X.) the particular property of continuous things is considered together with the cause of incommensurability; and it is shown that the particular property of continuous things is that there is always a part less than the least part of them and that they can be reduced (or bisected) indefinitely. A continuous thing, therefore, is defined as that which is divisible to infinity (or indefinitely). In this proposition, moreover, he points out to us the first of the grounds of incommensurability, which we have just stated (i. e. in the two previous sentences); and on this basis he begins a comprehensive examination of commensurability and incommensurability, distinguishing by means of remarkable proofs between that which is commensurable absolutely, that which is commensurable in square and in line together, that which is incommensurable in both of these (i. e. in square and line), and that which is incommensurable in line but commensurable in square[16], and proving how two lines can be found incommensurable with a

given line, the one in length only, the other in length and square[17]. Page 5.
Thereupon he begins to treat of commensurability and incommensurability with reference to proportion and also with reference to addition and division (or subtraction)[18], discussing all this exhaustively and completely satisfying the just requirements of each case. Then after these propositions dealing with commensurable and incommensurable continuous quantities in common[19], comes an examination of the case of rationals and irrationals, wherein he distinguishes between those lines which are rational [straight lines commensurable] in both respects, i. e., in length and square, — and no irrationality whatsoever is conceivable with respect to these —, and those which are rational [straight lines commensurable] in square [only][20], from which is derived the first irrational line, which he calls the medial[21], and which is, then, of all [irrational] lines, the most homogeneous to the rational. Consequently in accordance with what has been found in the case of the rational lines, some medial lines are medial [straight lines commensurable] in length and square, whereas others are medial [straight lines commensurable] in square only[22]. The special homogeneity of medial with rational lines is shown in the fact that rational [straight lines commensurable] in square contain a medial area (or rectangle), whereas medial [straight lines commensurable] in square contain sometimes a rational and sometimes a medial area[23]. From these [rational and medial straight lines commensurable in square only] he derives other irrational lines many in kind, such as those which are produced by addition[24] and those which are produced by subtraction[25]. There are several points of distinction between these: in particular, the areas to which the squares upon them are equal and the relation of these areas to the rational line[26]. But, to sum up, after he has shown us what characteristics these lines have in common with one-another and wherein they are different from one-another, he finally proves that there is no limit to the number of irrational lines or to the distinctions

between them[27]. That is, he demonstrates that from one irrational line, the medial, there can be derived unlimited (or infinite) irrational lines different in kind. He brings his treatise to an end at this point, relinquishing the investigation of irrationals because of their being unlimited (or infinite) in number. The aim, profit, and divisions of this book have now been presented in so far as is necessary.

Page 6. § 5. A thorough investigation is, however, also necessary in order to understand the basis of their distinction between the magnitudes. Some of these they held to be commensurable, others of them incommensurable, on the ground that we do not find among the continuous quantities any measure (or magnitude)[28] that is a minimum; that, on the contrary, what is demonstrated in proposition i. (Euclid, Book X.) applies to them, namely, that it is always possible to find another measure (or magnitude) less than any given measure (or magnitude)[29]. In short [they asked] how it was possible to find various kinds of irrational magnitudes, when all finite continuous quantities bear a ratio to one-another: i. e. the one if multiplied, must necessarily exceed the other, which is the definition of one thing bearing a ratio to another, as we know from Book V.[30]. But let us point out that the adoption of this position (i. e. the one just outlined) (or definition) does not enable one to find the measure of a surd or irrational[31]. On the contrary, we must recognise what the ultimate nature of this matter consists in[32], namely, that a common measure exists naturally for the numbers, but does not exist naturally for the continuous quantities on account of the fact of division which we have previously set forth, pointing out several times that it is an endless process. On the other hand it (i. e. the measure) exists in the case of the continuous quantities by convention as a product of the imaginative power[33]. We assume, that is, some definite measure or other and name it a cubit or a span or some such like thing. Then we compare this definite unit of measurement[34] which we have recognised, and name those continuous quantities which we can measure by it, rational, whereas those which cannot be measured by it, we classify as irrationals. To be rational in this sense is not a fact, therefore, which we derive from nature, but is the product of the mental fancy which yielded the assumed measure. All continuous quantities, therefore, cannot be rational with reference to one common measure. For the assumed measure is not a measure for all of them; nor is it a product of nature but of the mind. On the other hand, the continuous quantities are not all irrational; for we refer the measurement of all magnitudes whatsoever to some regular limit (i. e. standard)[35] recognised by us.

§ 6. It should be pointed out, however, that the term, proportion, is used in one sense in the case of the *whole*, i. e. the finite and homogeneous continuous quantities[36], in another sense in the case of the commensurable continuous quantities, and in still another sense in the case of the continuous quantities that are named rational[37]. For with reference to continuous quantities the term, ratio, is understood in some cases only in the sense that it is the relation of finite continuous quantities to one-another with respect to greatness and smallness[38]; whereas in other cases it is understood in the sense that it denotes some such relation as exists between the numbers, all commensurable continuous quantities, for example, bearing, as is evident, a ratio to one-another like that of a number to a number; and finally, in still other cases, if we express the ratio in terms of a definite, assumed measure, we become acquainted with the distinction between rationals and irrationals. For commensurability is also found in the case of the irrationals, as we learn from Euclid himself, when he says that some medials are commensurable in length, but others commensurable in square only; whence it is obvious that the commensurables among the irrationals also bear a ratio to one-another like that of a number to a number, only this ratio is not expressible in terms of the assumed

Page 7. Ms. 25. r°.

measure[39]. For it is not impossible that there should be between medials the ratio of two to one, or three to one, or one to three, or one to two, even if the quantity (i. e. finally, the unit of measurement) remains unknown. But this application (i. e. of the term, ratio) does not occur in the case of the rationals, since we know for certain that the least (or minimum) in their case is a known quantity. Either it is a cubit, or two cubits, or some other such definite limit (or standard). That being the case, all the finite continuous quantities bear a ratio to one-another according to one sense (i. e. of the term, ratio), the commensurables according to another sense, and all the rationals according to still another. For the ratio of the rationals is that of the commensurables also, which is the ratio of the finites.
Page 8. But the ratio of the finites is not necessarily that of the commensurables, since this ratio (i. e. that of the finites) is not necessarily like the ratio of a number to a number. Nor is the ratio of the commensurables necessarily that of the rationals. For every rational is a commensurable, but not every commensurable is a rational[40].

§ 7. Accordingly when two commensurable lines are given, it is self-evident that we must suppose that they are either both rational or both irrational, and not that the one is rational and the other irrational. For a rational is not commensurable with an irrational under any circumstance. On the other hand, when two incommensurable straight lines are given, one of two things will necessarily hold of them. Either one of them is rational and the other irrational, or both of them are irrational, since in the case of rational lines there is found only commensurability, whereas in the case of irrational lines commensurability is found on the one hand, and incommensurability on the other. For those irrational lines which are different in kind, are necessarily incommensurable, because if they were commensurable, they would necessarily agree in kind, a line which is commensurable with a medial being a medial[41], and one which is commensurable with an apotome being an apotome[42], and the other lines likewise, as the Geometer (i. e. Euclid) says.

§ 8. Not every ratio, therefore, is to be found with the numbers[43]; nor do all things that have a ratio to one-another, have that of a number to a number, because in that case all of them would be commensurable with one-another, and naturally so, since every number is homogeneous with finitude (or the finite), number not being plurality, the correspondence notwithstanding, Ms. 25 v.° but a defined (or limited) plurality[44]. Finitude (or the finite), however, comprehends more than the nature of number[45]; and so with respect to continuous quantities we have the ratio that pertains to finitude (or the finite), in some cases, and the ratio that pertains to number, since it also is finite, in still others. But we do not apply[46] the ratio of finite (or determinate) things to things that are never finite (i. e., are indeterminate), nor the ratio of commensurables to incommensurables. For the latter ratio (i. e., the ratio of commensurables) determines the least part (or submultiple, i. e., the minimum) and so makes everything included in it commensurable; and the former (i. e., the ratio of finite things) determines now the greatest (or greater) and now the least (or less) of the parts[47]. For everything finite is in fact Page 9. finite only by reason of the finitude which is the first (or principle) of the finitudes[48], but we for our part also give some magnitudes finitude in one way and others in another way[49]. So much it was necessary to cite in our argument concerning these things.

§ 9. But since irrationality comes to pass in three ways, either by proportion, or addition, or subtraction[50], it seems to me to be a matter worthy of our wonder (or contemplation), how, in the first place, the all-comprehending power of the Triad distinguishes and determines the irrational nature, not to mention any other, and reaches to the very last of things[51], the limit (or bound) derived from it appearing in all things[52]; and in the second place, how each one of these three kinds [of irrationals] is necessarily distinguished by one of the means, the geometric distinguishing

one, the arithmetical another, and the harmonic the third. The substance of the soul, moreover, seems to comprehend the infinity of irrationals; for it is moved directly concerning the nature of continuous quantities[53] according as the ideas (or the forms) of the means which are in it, demand, and distinguishes and determines everything which is undefined and indeterminate in the continuous quantities, and shapes them in every respect[54]. These three [means] are thus bonds[55] by virtue of which not one even of the very last of things, not to mention any other, suffers loss (or change)[56] with respect to the ratios (or relations)[57] which exist in it. On the contrary, whenever it becomes remote from anyone of these ratios (or relations) naturally[58], it makes a complete revolution and possesses the image of the psychic ratios (or relations)[59]. Accordingly whatsoever irrational power there is in the whole (or in the universe), or whatsoever combination there is, constituted of many things added together
Page 10. indefinitely, or whatsoever Non-being there is, such as cannot be described (or conceived) by that method which separates forms, they are all comprehended by the ratios (or relations) which arise in the Soul[60]. Consequently incommensurability is joined and united (i. e., to the whole) by the harmonic mean, when it appears in the whole as a result of the division (or separation) of forms[61]; and addition that is undefined by the units (or terms) of the concrete numbers, is distinguished by the arithmetical mean[62]; and medial irrationals of every kind that arise in the case of irrational powers, are made equal by reason of the geometric mean[63]. We have now dealt with this matter sufficiently.

§ 10. Since, moreover, those who have been influenced by speculation[64] concerning the science (or knowledge) of Plato, suppose that the definition of straight lines commensurable in length and square and commensurable in square only which he gives in his book entitled, *Theaetetus*, does not at all correspond with what Euclid proves concerning these lines, it seems to us that something should be said regarding this point[65]. After, then, Theodorus had discussed with Theaetetus the proofs of the *powers* (i. e. squares)[66] which are commensurable and incommensurable in length relatively to the *power* (square) whose measure is a [square] foot[67], the latter had recourse to a general definition of these *powers* (squares), after the fashion of one who has applied himself to that knowledge which is in its nature certain (or exact)[68]. Accordingly he divided all numbers into two classes[69]; such as are the product of equal sides (i. e. factors)[70], on the one hand, and on the other, such as are contained by a greater side (factor) and a less; and he represented the first [class] by a square figure and the second by an oblong, and Ms. 26 r.° concluded that the *powers* (squares) which *square* (i. e. form into a square figure) a number whose sides (factors) are equal[71], are commensurable both in square and in length, but that those which *square* (i. e. form into a square figure) an oblong number, are incommensurable with the first [class] in the latter respect (i. e. in length), but are commensurable occasionally with one another in one respect[72]. Euclid, on the other hand, after he had examined this treatise (or theorem) carefully for some time and had determined the lines which are commensurable in length and square, those, namely, whose *powers* (squares) have to one-another the ratio of a square number to a square number, proved that all lines of this kind are always commensurable in length[73]. The difference between Euclid's statement (or proposition)[74] and that of Theaetetus which precedes it, has not escaped us. The idea of determining these *powers* (squares) by means of the Page 11. square numbers is a different idea altogether from that of their having to one-another the ratio of a square [number] to a square [number][75]. For example, if there be taken, on the one hand, a *power* (square) whose measure is eighteen [square] feet, and on the other hand, another *power* (square) whose measure is eight [square] feet, it is quite clear that the one [power or square] has to the other the ratio of a square number to a square number, the numbers, namely, which these two double[76], notwithstanding the fact that the two [powers or squares] are determined by means of oblong numbers. Their sides, therefore, are commensurable according to the definition (thesis) of Euclid, whereas according to the definition (thesis) of Theaetetus they are excluded from this category. For the two [powers or squares] do not *square* (i. e. do not form into a square figure) a number whose sides (factors) are equal, but only an oblong number. So much, then, regarding what should be known concerning these things[77].

§ 11. It should be observed, however, that the argument of Theaetetus does not cover every *power* (square) that there is[78], be it commensurable in length or incommensurable, but only the *powers* (squares) which have ratios relative to some rational *power* (square) or other, the *power* (square), namely, whose measure is a [square] foot. For it was with this *power* (square) as basis that Theodorus began his investigation concerning the *power* (square) whose measure is three [square] feet and the *power* (square) whose measure is five (square] feet, and declared that they are incommensurable (i. e. in length) with the *power* (square) whose measure is a [square] foot[79]; and [Theaetetus] explains this by saying: "We defined as *lengths* [the sides of the *powers* (squares)][80] which *square* (i. e. form into a square figure) a number whose sides (factors) are equal, but [the sides of the *powers* (squares)] which *square* (i. e. form into a square figure) an oblong number, we defined as *powers* (i. e. surds)[81], inasmuch as they are incommensurable in length[82] with the former [*powers* (squares)], the *power*, namely, whose measure is a [square] foot and the *powers* which are commensurable with this *power* in length, but are, on the other hand, commensurable with the areas (i. e. the squares) which can be described upon these [lengths][83]. The argument of Euclid, on the contrary, covers every *power* (square) and is not relative to some assumed rational *power* (square) or line only. Moreover, it is not possible for us to prove by any theorem (or proposition) that the *powers* (squares) which we have described above[84], are commensurable [with one-another] in length, despite the fact that they are incommensurable in length with the *power* (square) whose measure is a [square] foot, and that the unit [of measurement] which measures the lines, is irrational, the lines, namely, on which these *powers* (i. e. the squares 18 and 8) are imagined as described[85]. It is difficult, consequently, for those who seek to determine a recognised measure for the lines which have the power to form these *powers* (i. e. the lines upon which these *powers* can be formed), to follow the investigation of this [problem] (i. e. of irrationals), whereas whoever has carefully studied Euclid's proof, can see that they (i. e. the lines) are undoubtedly commensurable [with one-another]. For he proves that they have to one-another the ratio of a number to a number[86]. Such is the substance of our remarks concerning the uncertainty about Plato. Page 12.

§ 12. The philosopher (i. e. Plato), moreover, establishes, among other things, that here (i. e. in the *lines* of Theaetetus 148 a., which are commensurable in square but not in length) are incommensurable magnitudes. We should not believe, therefore, that commensurability is a quality of every magnitude as of all the numbers; and whoever has not investigated this subject, shows a gross and unseemly ignorance of what the Athenian Stranger says in the seventh treatise of the Book of the Laws[87], [namely], "And besides there is found in every man an ignorance, shameful in its nature and ludicrous, concerning everything which has the dimensions, length, breadth, and depth[88]; and it is clear that mathematics can free them from this ignorance[89]. For I hold that this [ignorance] is a brutish and not a human state, and I am verily ashamed, not for myself only, but for all Greeks, of the opinion of those men who prefer to believe what this whole generation believes, [namely], that commensurability is necessarily a quality of all magnitudes. For everyone of them says: "We conceive that those things are essentially the same, Ms. 26 v.⁰

some of which can measure the others in some way or other[90]. But the fact is that only some of them are measured by common measures, whereas others cannot be measured at all". It has also been proved clearly enough by the statement (or proposition) in the book that goes by the name of Theaetetus, how necessary it is to distinguish lines commensurable in length and square relatively to the assumed rational line, that one, namely, whose measure is a foot, from lines commensurable in square only. We have described this in what has preceded; and from what has been demonstrated in the generally-known work (i. e. Euclid)[91], it is easy for us to see that there has been described (or defined) for us a distinction that arises when two rational lines are added
Page 13. together[92]. For it says that it is possible for the sum of two lines to be either rational or irrational, even if both lines are rational, the line composed of two lines rational (and commensurable) in length and square being necessarily rational, whereas the line which is composed of two lines that are rational (and commensurable) in square only, is irrational.

§ 13. If, then, the discussion in Plato's book named after Parmenides should not contradict this (i. e. the existence of incommensurable magnitudes), [let it be observed that] he has considered therein the First Cause (i. e. The One) in connection with the division (or separation) of commensurable from incommensurable lines[93]. In the first hypothesis[94], namely, the equal, the greater, and the less are discussed together; and in this case the commensurable and the incommensurable are conceived of as appearing in the imagination together with measure[95]. Now these (i. e. the commensurable, the incommensurable, (and measure ?)) cover everything which by nature possesses the quality of being divided, and comprehend the union (combination) and separation (division)[96] which is controlled by the God who encircles the world[97]. For inasmuch as divine number[98] precedes the existence of the substances of these things, they are all commensurable conformably to that cause, God measuring all things better than one measures the numbers; but inasmuch, as the incommensurability of matter is necessary for the coming into existence of these things, the potentiality (or power) of incommensurability is found in them[99]. It is, moreover, apparent that limit is most fit to control in the case of the commensurables, since it originates from the divine power, but that matter should prevail in the case of those magnitudes which are named incommensurables[100]. For if you wish to understand whence incommensurability Ms. 27. r°. is received by the magnitudes, [you must recognise that] it is only found in that which can be imagined as potentially divisible into parts to infinity (or indefinitely); and [that] parts originate necessarily only from matter, just as the whole from form; and [that] the potential in everything proceeds from matter, just as the actual from the other cause (i. e. form)[101]. The incommensurability of geometrical continuous quantities, therefore, would not have its origin in matter or anywhere, were there not, as Aristotle says,[102] two kinds of matter namely, Page 14. intelligible matter on the one hand, and sensible matter, on the other, the representation of bulk, or, in short, of extension, in geometrical figures being by means of intelligible matter only. For where only form and limit are found, there everything is without extension or parts, form being wholly an incorporeal nature. But line[103], figure (or plane), and bulk, and everything which belongs to the representative (or imaginative) power within us, share in a particular species of matter[104]. Hence numbers are simple and free by nature from this incommensurability, even if they do not precede the incorporeal life[105]; whereas the limits (or bounds) which come thence[106] into the imagination and to a new existence in this representative (or imaginative) activity, become filled with irrationality and share in incommensurability, their nature, in short, consisting of the corporeal accidents[107].

§ 14. We must return, however, to the object of our discussion and consider whether it be possible for some lines to be rational notwithstanding their incommensurability with the lines[108] which have been assumed as rational in the first place. We must, in short, examine whether it be possible for the same magnitude[109] to be at once rational and irrational. Now we maintain that measures (i. e. in the case of the continuous quantities) are only by convention and not by nature[110], a fact which we have often pointed out before. Consequently the denotation of the terms, rational and irrational, necessarily changes according to the convential measure that is assumed[111]; and while things which are incommensurable with one another can never be commensurable in any sense whatsoever, it would nevertheless be possible for what is rational to become irrational, since the measures might be changed. But as it is desirable that the properties of rationals and irrationals should be definite and general[112], we assume some one measure and distinguish the properties of rational and irrational continuous quantities relatively to it. For if we did not
Page 15. distinguish between these relatively to some one thing, but designated a continuous quantity which the assumed measure does not measure, rational, we would assuredly not preserve the definitions of this learned scholar[113] distinct and unconfused. On the contrary, a line which we would show to be a medial, would be considered by another to have no better a claim to be a medial than a rational, since it does not lack measure[114]. But this is not a scientific method. As Euclid says, it is necessary that one line should be [assumed as] rational[115].

§ 15. Let, then, the assumed line be rational, since it is necessary to take some one line as rational; and let every line which is commensurable with it, whether in length or in square,
Ms. 27 v.° be called rational. Let these be convertible terms[116]; and let it be granted, on the one hand, that the line which is commensurable with the rational line, is rational, and, on the other, that the line which is rational, is commensurable with the rational line, since

Euclid defined as irrational the line which is incommensurable with this line[117]. On these premises, then, all lines that are commensurable with one-another in length, are not necessarily proportional to the assumed line, even if they be called rational; nor are they necessarily called commensurable[118], because this line measures them. But when they are proportional to the assumed line either in square or in length, they are necessarily named rational, since every line which is commensurable with the assumed line in square or in length, is rational. The commensurability of these lines in length or in square is an additional qualification of them[119] and does not refer to their proportion to the assumed line, since medial lines, for example, are sometimes commensurable in length and sometimes commensurable in square only. He misses the mark, therefore, who says that all rational lines which are commensurable in length, are rational in virtue of their length[120]. Consequently the assumed line does not necessarily measure every rational line. For lines which are commensurable in square with the assumed rational line, are called rational without exception on the ground that if we take two square areas, one of them fifty [square] feet and the other eighteen [square] feet, the two areas are commensurable with the square on the assumed rational line whose measure is a foot, and the lines upon which they are the squares, are commensurable with one-another, although incommensurable both Page 16.
of them with the assumed line. There is no objection at all, then, to our calling these two lines rational and commensurable in length; rational, namely, inasmuch as the two squares upon them are commensurable with the square upon the assumed line, and commensurable in length inasmuch as even if the unit of measurement[121] which is common to them, is not the assumed rational line, there is another measure which measures them[122]. Commensurability with the assumed rational line, therefore, is the only basis of rationality[123]. Continuous quantities, on the other hand, are commensurable with one-another, in length or in

square only, by reason of a common measure, be that what it may.

§ 16. It has been established, moreover, that the area (or rectangle) contained by two rational lines commensurable in length is rational[124]. It is not impossible, then, that the lines containing this area should be at the same time rational —, the reference in this case being to their homogeneity with the rational line, their condition, namely, compared with it in length or in square only[125] —, and also commensurable with one-another in length[126] —, where the reference is to the fact that they have necessarily a common measure. We must assume, that is, that in this case we have two lines such that containing the given area, they are named rational and are commensurable also [with one-another] in length without being measurable by the given rational line, although, on the other hand, the squares upon them are commensurable with the square upon that line. It has been demonstrated, however, that this area is rational. For it is commensurable with each of the squares upon the lines containing it; and these are commensurable with the square upon the given line; and, therefore, this area is also necessarily
Ms. 28 r.° commensurable with it and thus rational[127] if, however, we take the two given lines as commensurable [with one-another] in length but incommensurable both in length and square with the line which is rational in the first place, we cannot prove in any way that the area contained by them is rational. On the contrary if you apply the length to the breadth[128] and find the measure of the area, it will not be an extension such as you can
Page 17. prove to be rational. For example, if the ratio to one-another of the two lines containing it be three to two, then the area of the rectangle (or area) must be six times something-or-other[129]. But this something-or-other is an unknown quantity, since the half and the third of the lines themselves are irrational[130]. It is not correct, however, for anyone to maintain that there are two kinds of rational lines, those, namely, which are measured by

the line which is rational in the first place, and those which are measured by another line which is not commensurable with that line. On the other hand lines commensurable in length are of two kinds, those, namely, which are measured by the line which is rational in the first place, and those which are commensurable with one-another, although they are measured by another line which is incommensurable with that line. Euclid never names those lines which are incommensurable with the given rational line in both respects (i. e. in length and in square) rational. And what would have prevented him doing so, if instead of determining rational lines by reference to that line alone, he had also determined them by adopting some other measure from those lines which are called rational and referred them to it?[131]

§ 17. Plato gives even rational lines diverse names. We know that he calls the line which is commensurable with the given rational line, *length*[132], and that he names that one which is commensurable with it in square only, *power*[133], adding on that account[134] to what he has already said, the explanation, "Because it is commensurable with the rational line in the area to which the square upon it is equal"[135]. Euclid, on the other hand, calls the line which is commensurable with the rational line, however commensurable[136], rational, without making any stipulation whatsoever on that point: a fact which has been a cause of some perplexity to those who found in him some lines which are called rational, and are commensurable, moreover, with each other in length but incommensurable with the given rational line (i. e. in length). Page 18.
length). But perhaps he did not mean to measure all rational lines by the line which was assumed in the first place, but intended to give up that measure, despite the fact that in the definitions he proposed to refer the rationals to it, and to change to another measure incommensurable with the first, naming such lines[137], then, without noting it[138], rational because they were commensurable with the given rational line in one respect that is, in square only, but referring their commensurability in

length to another measure, subscribing in this instance to the opinion that they were commensurable (i. e. with another) in both respects, but not rational in both respects (as, e. g., $\sqrt{2}$ and $\sqrt{8}$).

§ 18. We maintain, therefore, that some straight lines are wholly irrational and others rational. The irrational are those whose lengths are not commensurable with the length of the rational line nor their squares with its square. The rational are those which are commensurable with the rational line in either respect (i. e. in length or in square only). But some of the rationals are commensurable with one-another in length, others in square only; and some of those which are commensurable with one-another in length, are commensurable with the rational
Ms. 28 v.° line in length, others are incommensurable (i. e. in length, but commensurable in square) with it. In short, all lines which are rational and commensurable in length with the rational line, are commensurable with one-another (i. e. in length), but all rational [lines] which are commensurable with one-another in length, are not commensurable with the rational line (i. e. in length)[139]. Some of the lines, again, which are commensurable with the rational line in square, for which reason, indeed, they also are named rational[140], are commensurable with one-another in length, but not relatively to that line; others are commensurable in square only (i. e. with the rational line and with one-another). The following example will make this clear. If, namely, we take an area (or rectangle) contained by two rational lines which are commensurable in square with the given line, but with one-another in length, then this area is rational. If, on the other hand, the area is contained by two lines which are commensurable with one-another and with the rational line in square only, it is medial[141]. That is the sum and substance of what we have to say concerning such things[142]. It should be evident now, however, that if [it be stated that] an area is contained by two lines rational and commensurable in square [only], [this means that]

the two rational lines are commensurable with one-another and with the given rational line in square only[143]; whereas if [it be stated that] an area is contained by two lines rational and commensurable in length, [this may mean either (i) that] the two rational lines are commensurable with one-another and with the rational line in length, or [(2) that] they are commensurable with the rational line in square only, but with one-another in another respect (i. e. in length). Page 19.

§ 19. We must also consider the following fact. Having found by geometrical proportion that the medial line is a mean proportional between two rational lines commensurable in square only and, therefore, that the square upon it is equal to the area (or rectangle) contained by these two lines[144] —, the square upon a medial line being one which is equal to the rectangle contained by the two assigned lines as its adjacent sides[145] —, he (i. e. Euclid) always assigns the general term, medial, to a particular species (i. e. of the medial line)[146]. For the medial line the square upon which is equal to the rectangle contained by two rational lines commensurable in length, is necessarily a mean proportional to these two rationals; and the line the square upon which is equal to the rectangle contained by a rational and an irrational line, is also of that type (i. e. a mean proportional); but he does not name either of these medial, but only the line the square upon which is equal to the given rectangle[147]. Moreover since in every case he derives the names of the *powers* (i. e. the square-areas) from the lines upon which they are the squares, he names the area on a rational line rational[148] and that on a medial line medial.

§ 20. Comparing, furthermore, the medials theoretically to the rational lines[149], he says that the former resemble the latter inasmuch as they are either commensurable in length or commensurable in square only, and the area (or rectangle) contained by two medials commensurable in length is necessarily medial, just as the area contained by two rationals commensurable in length is, on the other hand, rational[150]. The area, moreover, contained by two medials commensurable in square only is sometimes rational and sometimes medial[151]. For just as the Ms. 29 r.º square on a medial line is equal to the area contained by two Page 20. rationals commensurable in square, so the square on a rational line is equal sometimes to the area contained by two medial lines commensurable in square. There are thus three kinds of medial areas: the first contained by two rational lines commensurable in square, the second by two medials commensurable in length, and the third by two medials commensurable in square; and there are two kinds of rational areas: the one contained by two rational lines commensurable in length, and the other by two medial lines commensurable in square[152]. It appears, then, that the line which is taken in [mean] proportion between two medial lines commensurable in length, is, together with that one which is taken in mean proportion between two rational lines commensurable in square, in every case medial[153], but that the line which is taken in mean proportion between two medials commensurable in square[154], is sometimes rational and again medial, so that the square upon it is now rational and now medial. Thus we may have two medial lines commensurable in square only, just as we may have two rational lines commensurable in square only, and the ground of distinction (or variance) between the areas contained by the two sets of lines[155] must be the line which is the mean proportional between these two extremes, namely, either a medial between two rationals or a medial between two medials, or a rational between two medials[156]. In short, sometimes the bond (i. e. the mean) is like the extremes, and sometimes it is unlike. But we have discussed these matters sufficiently.

§ 21. Subsequent to his investigation and production of the medial line, he (i. e. Euclid) began, after careful consideration, an examination of those irrational lines that are formed by addition and division (i. e. subtraction) on the basis of the examination which he had made, of commensurability and incommensurability[157], commensurability and incommensurability appearing also in those lines that are formed by addition and subtraction[158]. The first of the lines formed by addition is the binomial (binomium)[159]; for it also [like the medial with respect to all irrational lines[160]] is the most homogeneous of such lines to the rational line, being composed of two rational lines commensurable in square. The first of the lines formed by subtraction is the apotome[161]; for it also is produced by simply subtracting from a rational line another rational line commensurable with the whole[162] in square. We find, therefore, the medial line by assuming a rational side and a given diagonal[163] and taking the mean proportional between these two lines; we find the binomial by adding together the side and the diagonal; and we find the apotome by subtracting the side from the diagonal[164]. We should also recognise, however, that not only when we join together two rational lines commensurable in square, do we obtain a binomial, but three or four such lines produce the same thing. In the first case a trinomial (trinomium) is produced, since the whole line is irrational; in the second a quadrinomial (quadrinomium); and so on indefinitely. The proof of the irrationality of the line composed of three rational lines commensurable in square is exactly the same as in the case of the binomial[165].

Page 21.

Ms. 29 r.°

§ 22. It is necessary, however, to point out at the very beginning that not only can we take one mean proportional between two lines commensurable in square, but we can also take three or four of them and so on ad infinitum, since it is possible to take as many lines as we please, in [continued] proportion between two given straight lines. In the case of those lines also which are formed by addition, we can construct not only a binomial, but also a trinomial, or a first, or second trimedial, or that line which is composed of three straight lines incommensurable in square, such that, taking one of them with either of the [remaining] two[166], the sum of the squares[167] on them is rational, Page 22. but the rectangle contained by them is medial, so that in this case a major results from the addition of three lines. In the same way the line the square upon which is equal to a rational and a medial area, can be produced from three lines, and also the line the square upon which is equal to two medial areas[168]. Let us take, for example, three rational lines commensurable in square only. The line which is composed of two of these, is irrational, namely, the binomial. The area, therefore, contained by this line and the remaining line is irrational. Irrational also is the double of the area contained by these two lines. The square, therefore, on the whole line composed of the three lines is irrational. Therefore the line is irrational; and it is named the trinomial. And, as we have said, if there are four lines commensurable in square, the case is exactly the same; and so for any number of lines beyond that. Again, let there be three medial lines commensurable in square, such that one of them with either of the remaining two contains a rational rectangle. The line composed of two of these is irrational, namely, the first bimedial, the remaining line is medial, and the rectangle contained by these two is irrational[169]. The square on the whole line, therefore, is irrational [and therefore the line also]. The same facts hold with respect to the rest of the lines. Compound lines, therefore, formed by addition are infinite in number[170].

§ 23. In like manner we need not confine ourselves in the case of those irrational straight lines which are formed by division (i. e. subtraction), to making one subtraction only, obtaining thus the apotome, or the first, or second apotome of the medial, or the minor, or that [line] which produces with a rational area a medial whole, or that which produces with a medial area a medial whole[171]; but we can make two or three or four subtractions. For if we do that, we can prove in the same way [as in these] that the lines which remain, are irrational, and that each of them is one of the lines which are formed by subtraction. If from a rational line, for example, we cut off another rational line commensurable with the whole line in square, we obtain, for remainder, an apotome; and if we subtract from that line which has been cut off[172], and which is rational, and which Euclid calls the *Annex*[173], another rational line which is commensurable with it in square, we obtain, as remainder, an apotome; and if we cut off from the rational line which has been cut off from that line[174], another line commensurable with it in square, the remainder is likewise an apotome. The same thing holds true in the case of the subtraction of the rest of the lines[175]. There is no possible end, therefore, either to the lines formed by addition or to those formed by subtraction. They proceed to infinity, in the first case by addition, in the second by subtraction from the line that is cut off (i. e. the annex). It seems, then, that the infinite number of irrationals becomes apparent by such methods as these, so that [continued] proportion does not cease at a definite multitude (i. e. number) of means, nor the addition of compound lines come to an end, nor subtraction arrive at some definite limit or other[176]. With this we must be content so far as the knowledge of rationals[177] is concerned. Page 23. Ms. 30 r.°

§ 24. Let us begin again and describe its parts (i. e. the parts of Book X)[178]. We maintain, then, that the first part deals with the commensurable and incommensurable continuous quantities. For he (i. e. Euclid) establishes in it that in this instance (i. e. in the case of continuous quantities) incommensurability is a fact[179], [shows] what continuous quantities are incommensurable[180] and how they should be distinguished, and [explains] the nature of commensurability and incommensurability as regards proportion[181], the possibility of finding incommensurability in two ways, either with reference to length and square or with reference to length only[182], and the mode of each of them with respect to addition and subtraction[183], increase and diminution. That is, in all these propositions, fifteen in number, he instructs us concerning commensurable and incommensurable continuous quantities[184].

§ 25. In the second part he discusses[185] rational lines and medials such as are commensurable with one-another in square and length, the areas that are contained by these lines, the homogeneity of the medial line with the rational, the distinction between them, the production of it (i. e. of the medial), and such like subjects[186]. For the fact that it is possible for us not only to find two rational lines commensurable in length but also to find
Page 24. two such lines commensurable in square [only], shows that we can obtain two lines incommensurable with the assigned line, the one in square and the other in length only[187]. If, then, we take a rational line incommensurable in length with a given line, we obtain two rational lines commensurable in square only. And if we take the mean proportional between these, we obtain the first irrational line[188].

§ 26. In the third part he provides the means for obtaining the irrationals that are formed by addition, by furnishing for that operation two medial lines commensurable in square only which contain a rational rectangle, two medial lines commensurable in square which contain a medial rectangle[189], and two straight lines neither medial nor rational, but incommensurable in square, which make the sum of the squares upon them[190] rational, but the rectangle contained by them medial, or, conversely, which make the sum of the squares upon them medial, but the rectangle contained by them rational, or which make both the sum of the squares and the rectangle medial and incommensurable with one-another[191]. These propositions, namely, and everything that appears in the third part, were selected by him for the sole purpose of finding the irrational lines which are formed by addition. For if those lines which have been obtained (i. e. in the
Ms. 30 v.° third part) be added together, they produce these irrational lines.

§ 27. In the fourth part he makes known to us the six irrational lines that are formed by addition[192]. These are composed either of two rational lines commensurable in square[193], — two [rational] lines commensurable in length forming when added together a whole line that is rational —, or of two medial lines commensurable in square[194], — two medials commensurable in length forming when added together a medial line —, or of two lines, unqualified[195], which are incommensurable in square. Three are irrational for the reason we have given[196]; two are composed of two medials commensurable in square; and one of two rationals commensurable in square[197]: six lines altogether, the [lines in the] third part having been produced in order to establish these [six lines] in the fourth part. In this fourth part, then, he shows us the composition of these six irrational lines by forming some of them, namely, the first three, from lines commensurable in square, and the others, that is to say, the second three, from [lines] incommensurable in square[198], in the case of the three latter [propositions] either making the sum of the squares upon them (i. e. upon the two lines incommensurable in square) rational but the rectangle contained by them medial[199], or, conversely, making the sum of the squares upon them medial but the rectangle contained by them rational, or, finally, making both the sum of the squares upon them and the rectangle contained by them medial and incommensurable with one-another. For were they commensurable with one-another (i. e., the sum of the squares and the rectangle), the two lines which have been added together, would be commensurable in length[200]. He proves also the converse of these propositions in some form or other, namely, that each of these six irrationals is divided at one point only[201]. For he demonstrates that if the two lines are rational and commensurable in square, then the line composed of them is a binomial; and that if this line be a binomial, then it can be composed of these two lines only and of no others; and so analogously with the rest of the lines. In this part, therefore, we have two series of six propositions, the first six putting together these six irrational lines, and the second six demonstrating the converse propositions.

Page 25.

§ 28. After these parts[202] the binomial line is [at last] found in the fifth part, the first, namely, of those lines which are formed by addition[203]. Six varieties of this line are set forth[204]. And I do not think that he did this (i. e. found the six binomials) without a [definite] purpose, but provided them[205] as a means to the knowledge of the difference between the six irrational lines formed by addition, by means of which (i. e. the binomials) he might make known a particular property of the areas to which the squares upon these (i. e. upon the six irrationals formed by addition) are equal[206].

§ 29. This [fifth] part, consequently, is followed by the sixth part in which he examines these areas and shows that the square on the binomial is equal to the area contained by a rational line and the first binomial, that the square on the first bimedial is
Page 26. equal to the area contained by a rational line and the second binomial, and so forth[207]. These lines, therefore, (i. e. the six irrationals formed by addition) produce six areas contained [respectively] by a rational line and one of the six binomials[208].

§ 30. In the seventh part he discusses the incommensurability [with one-another] of the six irrational lines that are formed by addition, proving that any line which is commensurable with
Ms. 31 r.º anyone of these, is of the same order as it[209]. Applying, then, the squares upon them to rational lines he examines the breadths of the areas [thus produced] and finds six other [propositions], the converse of the six mentioned in the sixth part[210].

§ 31. In the eighth part he demonstrates the difference between the six irrationals that are formed by addition, by means of the areas to which the squares upon them are equal[211]. In addition he gives a clear proof of the distinction between these irrational lines that are formed by addition, by adding together a rational and a medial area, or, again, two medial areas[212].

§ 32. Thereafter in the ninth part he describes the six irrational lines that are formed by subtraction[213], in a way analogous to that in which he has described the six that are formed by addition, making the apotome to correspond to (or the contrary of)[214] the binomial, in that it is obtained by the subtraction of the less from the greater of the two lines which when added together, form the binomial; and the first apotome of a medial to correspond to (or the contrary of) the first bimedial; and the second apotome of a medial to the second bimedial; and the minor to the major; and that which produces with a rational area a medial whole, to that the square upon which is equal to a rational plus a medial area; and that which produces with a medial area a medial whole, to that the square upon which is equal to two medial areas. The reason for the application of these names to them is obvious. And just as he proves in the case of [the irrational lines that are formed by] addition[215], that each of them can be divided at one point [only], so he shows immediately after these [propositions concerning the irrational lines][216] which are formed by subtraction, that each of them has one *Annex* [only][217].

§ 33. In the tenth part in order to define these six irrational lines he sets forth some apotomes that are to be found in a manner analogous to that in which the binomials were found[218]. Page 27.

§ 34. This is followed in the eleventh part by the demonstration of the six irrational lines that are formed by subtraction[219], the squares upon which are equal [respectively] to a rectangle contained by a rational line and one of the apotomes, also numbering six, taken in their order.

§ 35. After examining this matter in the eleventh part, in the twelfth part he describes the incommensurability with one-another of these six irrationals, proving that any line which is commensurable with anyone of these, belongs necessarily to the same kind (or order) as it[220]. He points out also wherein they differ from one-another, showing this by means of the areas which, when applied to a rational line, give different breadths[221].

§ 36. When he comes to the thirteenth part he proves [in it] that the six irrational lines that are formed by addition, are different from the lines that are formed by subtraction[222], and that those which are formed by subtraction are different from one-another[223]. He distinguishes these also by the subtraction of areas just as he did the lines that are formed by addition, by means of the addition [of areas][224]. For subtracting a medial area from a rational, or a rational from a medial, or a medial from a medial, he finds the lines the squares upon which are equal to these areas, namely, the irrationals which are formed by subtraction. Thereafter, wishing to demonstrate the infinite number of irrationals, he finds lines unlimited (or infinite) in number, different in kind (or order), all arising from the medial line[225]. With this indication he brings this treatise to an end, relinquishing the investigation of irrationals, since they are infinite in number[226].

End of the first book of the commentary on Book X.

NOTES.

1 See paragraphs X & XI of Part I and Appendix A for the fact that *Powers* in this connection means *Squares*. See also WOEPCKE's *Essai*, p. 34, and note 3. The reference is to *Theaetetus*, 147d.—148a. For the first two sentences of the paragraph see J. L. HEIBERG, *Euclidis Elementa*, Vol. V, p. 414, ll. 1—3 and p. 415, ll. 7—8.

2 In Part II, paragraphs 17—20, the author develops this discovery of Theaetetus further and proves that the irrationals that are formed by addition, can be produced by means of arithmetical proportion, and those that are formed by subtraction, by means of harmonic proportion. The medial line is, of course the geometric mean between two rational lines commensurable in square only.

3 See PROCLUS, *Commentary on the first book of Euclid's Elements*. Basle, 1533, p. 35, l. 7: p. 92, l. 11: p. 99, l. 28: *The Commentary of Eutocius*, p. 204 of the Oxford edition of the Works of Archimedes; Frabicii *Bibliotheca Graeca*, 4th edition, Hamburg, 1793, Vol. III, p. 464 & 492.

4 WOEPCKE translates: "And, finally, he demonstrates clearly their whole extent", remarking that the author alludes to prop. 116 (115) of Book X. But the Arabic word *Tanāhi* does not mean *Extent*, but *End, Limit*, or *Finitude*; and the allusion is most probably to propositions 111—114, 111 showing that a binomial line cannot be an apotome, whereas 112—114 show how either of them can be used to rationalise the other. (W. p. 2, l. 6.) For the last sentence of para. I see J. L. HEIBERG, *Euclidis Elementa*, Vol. V, p. 414, ll. 15—16.

5 See J. L. HEIBERG, *Euclidis Elementa*, V, p. 417, l. 15, where ἄλογον and ἀνείδεον are used together in the same way; also p. 430, ll. 10—11, where ἄλογος and ἄρρητος are so used; see H. VOGT, *Die Entdeckungsgeschichte des Irrationalen....*, Biblioth. Mathem. 10, 1909/1910, p. 150, n. 1. See *Euclidis Elementa*, V, p. 417, ll. 19—20, for the translation: "The sect (or school) of Pythagoras was so affected by their reverence etc." (W. p. 2, ll. 13 & 10.)

6 That is, the world of generation and corruption, the sensible world, a brief statement of the Platonic position as, e. g., in *Phaedo* 79c (cf. *Symp.* 202a, *Republic* 478d, and *Tim.* 51d.) The sensible world is

in a state of continual change; there is no identity of quality in it; therefore no standard of judgment; and consequently no real knowledge of it or through it. The Arabic word, *Tashābuh*, means *Identity of quality or accident* (See *A Dict. of Technical Terms* etc., A. SPRENGER, Calcutta, 1862, Vol. I, p. 792, Dozy, Vol. I, p. 726, col. 1). It is probably a translation of the Greek word ὁμοιότης, which Pappus uses (See FR. HULTSCH, *Pappus*, Vol. III, Index Graecitatis, p. 22) (W. p. 2, l. 15).

[7] The Arabic word, *Al-Kawn*, means *The coming-to-be, or, The coming-to-be and the passing-away* (See *A Dict. of Technical Terms*, Vol. II, p. 1274). The Arabic word, *Marūr*, probably renders the Greek word ῥοή, Stream or Flow (W. p. 2, l. 16).

[8] See Plato, *De Legibus*, Lib. VII, 819, beginning.

[9] The Arabic phrase, *Mumayyizu-l-Aḥdāth*, is evidently an epithet for Plato, although I have not been able to find the Greek phrase upon which it is based (W. p. 2, l. 20).

[10] The Arabic phrase, *Al-Mustaḥiqqatu-lil-'ār*, qualifies *Al-amūr* (things) and not *Al-Aḥdāth* (accidents) as in SUTER's translation (W. p. 2, l. 20).

[11] The Arabic word, *Qawl*, may mean *Enunciation* or *Proposition* (cf. Glossary for references to the text; see BESTHORN & HEIBERG, *Eucl. Elem.*, Al-Hajjāj, i (p. 34, last line; p. 36, l. 16; p. 40, l. 4). *Ma'na* may mean *Definition* (cf. Glossary for references to the text).

[12] I interpret the Arabic phrase, *Ḥāṣṣatu-l-Maqūmati*, according to Wright's Grammar, 3rd Ed., Vol. II, p. 232, C, etc. The Arabic word, *Al-Maqūm*, occurs again in the next paragraph (Part. I., Para. 4., WOEPCKE's text, p. 4, l. 14) with *Al-Muthbat* as an interlinear gloss. According to this gloss *Al-Maqūm* means *Established, Known, Proved,* or *Belonging as a property or quality to* (W. p. 3, l. 3).

[13] Aristotle says that numbers are limited by *one* as their minimum, but that they have no maximum limit; whereas exactly the opposite is true of the continuous quantities. In consequence of the finiteness of the world they are limited as to their maximum, but have no minimum. (See Arist. *Phys.* III. 6, 207b, 1—5; cf. J. L. HEIBERG, *Euclidis Elementa*, Vol. V, p. 415, l. 9ff., 24ff.; p. 429, l. 26ff.; *Nicomachus of Gerasa*, University of Michigan Studies, Humanistic Series, Vol. XVI, Part II, p. 183, ll. 7—10.)

[14] SUTER's statement that „Hier befindet sich im MS. eine nicht lesbare, verdorbene Stelle" (p. 15, n. 24), based apparently on WOEPCKE's note 7 to page 3, that "Verba 'w-al-wuqūf' etc, usque ad 'Al-Musāwi', in texta omissa, margini adscripta, sed rescisso postea margine ex

parte peremta sunt", is misleading. The part of the text which has been omitted and then given in the margin, can be read with the exception of one word; and that word of which two letters can still be deciphered, can be reconstructed from the context. What has happened, is a curious case of haplography, and I have reconstructed the text. (See text and notes on the text.) (W. p. 3, ll. 18—19.)

For the philosophical notion expressed in these sentences compare The Commentary of Proclus on Book I of Euclid, ed., FRIEDLEIN, p. 87, l. 19ff.; p. 314, l. 16ff. It follows the Pythagorean doctrine that the principles of things are such contraries as *Limit and Unlimited* (the Finite and the Infinite), *Odd and Even* etc (cf. ARIST, *Metaph.*, A. I; 986a, 22ff.). In Platonism the Finite and the Infinite became the two principles out of which everything arose (Cf. Plato's *Philebos* 16c.ff.).

15 See Arist., *Metaph.* 1024a, 6. On the opposition of Unity and Plurality see Arist., *Mesaph.*, 1054a, 20ff., 1056b, 32, 1057a, 12. On Plurality as the genus of Number see Arist., *Metaph.*, 1057a, 2; and for the fact that One means a measure, i. e., is One, the arithmetical unit, or the first thing with the name of One, e. g., one foot, see Arist., *Metaph.*, 1052a, 15—1053b, 4; 1087b, 33—1088a, 4.

16 See Euclid, Bk. X., props. 5—9. For "Commensurable absolutely", cf. Def. I.

17 See Euclid, Bk. X., prop. 10.

18 See Euclid, props. 11—18, esp. 11, 15, 17, 18.

19 See Euclid, props. 11, 14, 17, 18. WOEPCKE's judgment on the text here is unsound, and SUTER, following it, misses the sequence of thought (See text and notes on the text,) (W. p. 5, l. 3ff.).

20 See Euclid, prop. 18, Lemma.

21 See Euclid, prop. 21.

22 The Arabic phrases, *Manṭiqatun fī-l-amraini* and *Manṭiqatun fī-l-quwwati*, which, rendered literally, give *Rational lines in both respects*, i. e. in square and length, and *Rational lines in square*, mean, as is clear from prop. 21, *Rational lines commensurable in square and length* and *Rational lines commensurable in square*. The following phrases, therefore, *mawsitatun fī-t-ṭuli wa-l-quwwati*, and *mawsitatun fī-l-quwwati*, literally, *Medial lines in length and square* and *Medial lines in square*, must mean *Medial lines commensurable in length and square* and *Medial lines commensurable in square*, as given above. Further confirmation of this fact may be found in the sentence which follows this one, where props. 21 & 25 are alluded to in the text. WOEPCKE's correction of

mantiqatun to *mawsitatun* is, therefore, to be accepted. SUTER's translation and note 35 are based on a misunderstanding of the text. The full phrase is given, Part I, para. 18. (W. p. 5, l. 6ff.)

[23] See Euclid, Bk. X., props. 21 & 25.

[24] See Euclid, Bk. X., props. 36ff.

[25] See Euclid, Bk. X., props. 73ff.

[26] See Euclid, Bk. X., props. 54ff. & 92ff.

[27] See Euclid, Bk. X., prop. 115.

[28] That is, a measure or magnitude which is common to all magnitudes as unity is common to the numbers, and which must be, therefore, the minimum measure or magnitude as One is the minimum number. The Arabic word, *Qadr*, means strictly *a Measurable Quantity or Magnitude*, and is then used, as in paragraph 3, Part I., in the sense of *a Measure* or *a Unit of Measurement* (See the Glossary for references to the text). (W. p. 6, l. 3; cf. p. 3, l. 10). Cf. J. L. HEIBERG, *Euclidis Elementa*, Vol. V, p. 437, ll. 1—4.

[29] Or, "To find another measure or magnitude less than the lesser of two given measures or magnitudes", if we adopt the marginal addition to the text, which seems unnecessary, however, and may have been added to make the statement conform more literally with the enunciation of proposition 1. The literal translation of the longer statement is: "That there can always be found another measure or magnitude less that any given measure or magnitude which is less than some measure or magnitude or other" (W. p. 6, ll. 4—5).

[30] Book V., Def. 4. Cf. J. L. HEIBERG, *Euclidis Elementa*, Vol. V., p. 418, l. 7ff. for this sentence in the Greek Scholia to Book X.

[31] Or, "An irrational measure", i. e., unit of measurement. As SUTER points out, Pappus probably means that it is not possible to prove by means of the propositions of Book V. alone that, e. g., $\sqrt{8}$ and $\sqrt{18}$ have a common measure, i. e. $\sqrt{2}$. (Page 17, note 40.)

[32] WOEPCKE's reading of the text is false at this point, and SUTER naturally gives up in despair. (See text and notes on the text.) Cf. for the following sentence J. L. HEIBERG, *Euclidis Elementa*, Vol. V, p. 418, l. 10ff. (W. p. 6, l. 10).

[33] Cf. J. L. HEIBERG, *Euclidis Elementa*, Vol. V., p. 417, l. 21. Τὰ μὲν μαθήματα φανταστικῶς νοοῦμεν, τοὺς δὲ ἀριθμοὺς δοξαστικῶς. That is, as a hypothesis accepted for practical purposes, based on generalizations from sense-perception, but not supported by any rational principle.

[34] *Al-ʿadad*, which is most probably the original reading of the text,

means in the first place *Quantity (Al-Kammiyyatu*; see *A Dict. of Technical Terms* etc", A. Sprenger, Vol. II, p. 949), and is here used in the sense of a quantity recognised as a unit of measurement. It is employed as a gloss for *Al-Qadr*, Measure, Unit of Measurement (cf. the previous note 28) in the MS. in the next paragraph, 6, and in paragraphs 11, 14, and 15 the two words are used as synonyms. (see Glossary for references to the text). The Greek word behind *Al-ʿadad* is probably ἀριθμὸς used as in Plato's *Philebus*, 25a, b; 25e, in the sense of that which numbers. On the argument of this paragraph up to this point cf. J. L. Heiberg, *Euclidis Elementa*, Vol. V, p. 418, l. 13ff. (W. p. 6, l. 14).

[35] That is, the Platonic πέρας. Cf. p. ara. 9 and the third note to para. 9 for this meaning of *ḥadd* (W. p. 6, last line).

[36] The original text of the MS., as given by Woepcke, p. 7, notes 1, 2, and 3, is to be prefered. *Al-Muṭlaq* is used in arithmetic to denote a *Whole* Number (See *A Dict. of Technical Terms* etc, A. Sprenger, Vol. II, p. 921; Dozy, Vol. II, p. 57, right column) and is used here probably by analogy in the same sense. Woepcke's text runs: — "It is also necessary to point out that the term "proportion" can in general be used to denote one thing in the case of etc." For this and succeeding sentences cf. J. L. Heiberg, *Euclidis Elementa*, Vol. V, p. 418, l. 17ff.

[37] Suter's note 47, p. 18, seems contrary to the whole argument of the paragraph. See especially the last sentence. Commensurable and rational magnitudes are not contraries, but neither are they identical.

[38] The Arabic phrase translated, "With respect to greatness and smallness", renders the Greek, κατὰ τὸ μεῖζον καὶ ἔλαττον — (Cf. J. L. Heiberg, *Euclidis Elementa*, Vol. V, p. 418, l. 19), i. e., "According to the great and small". The reference is probably to Euclid, Bk. V, Def. 4: — "Magnitudes are said to have a ratio to one-another which are capable, when multiplied, of exceeding one-another"; which, as T. L. Heath remarks, excludes the relation of a finite magnitude to a magnitude of the same kind which is either infinitely great or infinitely small and serves to show the inclusion of incommensurables. See para. 8, note 47.

b) This is the Platonic expression for continuous change. See, however, para. 8, note 47. G. J.

[39] See Euclid, Bk. X. props. 23, 27 & 28. Suter (See p. 19, notes 49 & 50) cites the two medials, $\sqrt[4]{5}$ & $\sqrt[4]{80}$, which are incommensurable with unity, but have the ratio to one-another of 1 to 2.

[40] See SUTER, *Beiträge zur Geschichte der Mathematik bei den Griechen und Arabern*, Abhandlungen zur Geschichte der Naturwissenschaften und der Medizin, Heft IV, Erlangen, 1922, p. 19, Note 52, and Appendix 2. Irrationals as has been stated, may be commensurable with one-another.

[41] Euclid, Bk. X. prop. 23.

[42] Euclid, Bk. X., prop. 103.

[43] Literally, within Number.

[44] WOEPCKE substitutes the supralinear gloss for the MS. reading, but the latter should be restored to the text, since the whole argument of the paragraph is based upon the idea of finitude. The Arabic phrase given in the MS. and translated, "A defined plurality" is a rendering of the Greek definition of number, πλῆθος ὡρισμένον (Eudoxus in "*Jambl. in Nicom. Arith*"., Introd., 10, 17: cf. the Aristotelian definition, πλῆθος τὸ πεπερασμένον, *Metaph.* 1020a, 13; 1088a, 5, whereas the supralinear gloss gives the Greek definition, "A progression (and retrogression) of multitude", προποδισμὸς, ἀναποδισμός. SUTER does not appear to have grasped the sense of the Arabic nor the syntax either, the matter is hardly philosophical (W. p. 8, l. 17 and note 5).

[45] WOEPCKE substitutes the supralinear gloss for the MS. reading. The Arabic word rendered by "Comprehends more than" should be read *Mujāwizatun*, not *Muḥāwiratun* or *Mujāwiratun*, as WOEPCKE suggests. The supralinear gloss, *Arfa'u min*, is an explanation of this term. The meaning is that finitude is a more comprehensive term than number, or, according to the gloss, is of a higher category, number being just one of its kinds and not therefore, exhausting its content, so that the ratio pertaining to number does not cover everything included under the ratio pertaining to finitude (W. p. 8, l. 17 and note 6).

[46] Literally, "We exclude the ratio of finite things from ....".

[47] Magnitudes are commensurable when they can be measured by some unit or other which is the least part or minimum. This minimum, therefore, is determined ultimately by the ratio of the magnitudes to one-another. The ratio of the finites, on the other hand, is defined (Euclid, Bk. V, Def. 4) so as to exclude the relation of a finite magnitude to a magnitude of the same kind *which is either infinitely great or infinitely small*, and to show the inclusion of incommensurables (See note 38 above).

b) Perhaps an allusion to Plato's *Parmenides*, 140c. See Introduction, p. 6 or a reference to the idea of continuous change; see para. 6. G. J.

[48] That is, presumably, the Pythagorean Monad. Cf. Part I, para. 13 (W. p. 13, l. 11) where it is stated that God measures all things better than one measures the numbers.

[49] Human reason, however, is limited and can find no natural unit of measurement for continuous quantities, as for numbers. For them, therefore, it uses various conventional units of measurement, which do not, therefore, apply to all finite things.

[50] For the para. see J. L. Heiberg, *Euclidis Elementa*, Vol. V, p. 484, l. 23—p. 485, l. 7. That is, medials, binomials, and apotomes.

[51] That is, the things furthest removed from their causes, the ideas or forms in the Universal Soul, and which are, then, only very dim reflextions or very poor images of these, devoid for the most part of form, or limit, or definiteness.

[52] That is, as the whole argument of this paragraph goes to prove (cf. also § 13), there is nothing absolutely irrational but only relatively so. From the point of view of an ideal system of knowledge, or, Platonically speaking, from the point of view of the World-Soul, everything is rational, but for human reason there are things which are relatively irrational, as, e. g., an infinite number of the continuous quantities. But these are, even for human reason, relatively rational, inasmuch as they all belong to one or other of the three classes of irrationals, and so admit of definition, have a certain form or limit. For the Platonist, and likewise the Neopythagorean and the Neoplatonist, the cause of this, that everything consists of three parts, is the number *three* conceived of as a metaphysical entity. "The Triad", says Nicomachus (in Photius), "is the cause of that which has triple dimensions and gives bound to the infinity of number". (Cf. T. Taylor, *Theoretic Arithmetic*, London, 1816, p. 181). The doctrine is derived from the Platonic speculation concerning the *separate* as distinct from the mathematical and sensible numbers. (Cf. Aristotle, *Metaph.* 1080a, 12—1083a, 14.) The *separate numbers* were not only the formal but also the material causes of everything. Even the universal soul, it should be observed, is threefold, being formed from same (τὸ ταυτόν), other (τὸ Θάτερον), and being (ἡ όυσία) (Cf. Plato's *Timaeus*, 37a; *Proclii Diodachi in Platonis Timaeum Commentaria*, E. Diehl, Leipzig, 1903, Vol. II, p. 295 (on Timaeus, 37a), p. 125, l. 23ff., p. 157, l. 27ff., p. 272, l. 21ff., p. 297, l. 17ff., p. 298, l. 2ff.). On the threeness of things see Aristotle, *De Coel.*, I. 1.

[53] The Greek corresponding to this passage in the Arabic is found in J. L. Heiberg's *Euclidis Elementa*, Vol. V, p. 485, l. 3ff. The Arabic,

Tushabbahu an ("seems to"), gives the Greek ἔοικεν; the Arabic, *Min qurbin* ("directly"), gives the Greek προσεχῶς; so far as the Arabic is concerned, the latter phrase might be translated. "By affinity". For the notion of the soul's being moved concerning the nature of the continuous quantities, see Plato's *Timaeus*, 37a. b.: "Therefore since she (the soul) is formed of the nature of same and of other and of being, of these three portions blended, in due proportion divided and bound together, and turns about and returns into herself, whenever she touches aught that has manifold existence or aught that has undivided, *she is stirred through all her substance*, (κινουμένη διὰ πάσης ἑαυτῆς) and she tells that wherewith the thing is same and that wherefrom it is different etc. (R. D. ARCHER-HIND's translation). Cf. also the commentary of Proclus on the Timaeus, E. DIEHL, Vol. II, p. 298, l. 2ff. & pp. 302—316 on Timaeus 37a. b., esp. p. 316, ll. 24—25 (W. p. 9, l. 11ff.).

54 For the interpretation of this sentence cf. Plato's *Timaeus*, 34c.—37c., where Plato describes the composition of the soul out of same, other, and being, goes on then (35b. ff.) to give an account of the mathematical ratios pertaining to the soul, to state, finally (36e. ff.), that God fashioned all that is bodily, within her; that from the midst even unto the ends of heaven she was woven in everywhere and encompassed it around from without; and that she can tell that wherewith anything is same and that wherefrom it is different, and in what relation or place or manner or time it comes to pass both in the region of the changing and in the region of the changeless that each thing affects another and is affected. See the commentary of Proclus on the Timaeus, E. DIEHL, Vol. II, p. 47, l. 28ff.: "Again the Soul is one and contains in itself that which is divine (τὸ θεῖον) and that which is irrational (τὸ ἄλογον), and in the divine part of itself it comprehends (περιέχει) rationally the irrational powers (τὰς ἀλόγους δυνάμεις) by which it governs the irrational and arranges it in a becoming manner". Cf. also Vol. II, p. 106, ll. 9—15, p. 108, l. 29ff., p. 160, l. 26ff., p. 208, l. 5ff. Cf. J. L. HEIBERG, *Euclidis Elementa*, Vol. V, p. 485, l. 3ff. for the Greek.

55 The basis of this view is again to be sought in the *Timaeus*, 31c.—32a. & 35b. ff. In the first passage Plato shows how the mean term of three numbers makes the three an unity and how the material world is a harmony through the proportion of its elements. In the second the harmony or unity of the soul is established by the three means. Cf. the commentary of Proclus, Vol. II, p. 198, l. 9ff.: "The three

means may be said to be the sources of union (ἑνωτικὰι) and connection (συνεκτικὰι) to the Soul or in other words to be unions, proportions, and bonds (δεσμοὺς). Hence also Timaeus names them, |*bonds*. For prior to this he had said that the geometric mean is the most beautiful of bonds and that the other means are contained in it. But every bond is a certain union." Cf. also Vol. II, pp. 16, 18, 21 (on Timaeus 31c.—32a.), p. 131, l. 30ff.; Vol. III, p. 211, l. 28ff. That is, the three means are the basis of the unity of the soul and of everything, therefore, rational or irrational.

56 Or, "Is deprived of the ratios etc." The reading of the ms. is *Yughlaba*, and the marginal gloss is *Yuqlaba*. The idea to be conveyed is evidently that of loss or change of property or relation (W., p. 9, l. 14).

57 I have adopted with Woepcke the marginal reading, *Al-Nisabi*, instead of the text's *Al-Sababi*, because *Al-Mawjūdati* (Which exist) seems to require this change. Observe also that *Al-Nisabi* (ratios) is used in the next sentence manifestly with reference to the same object as here The argument, moreover, deals with the ratios of the soul and those of continuous quantities, and how the three means are the causes of union therein (W., p. 9, l. 15).

58 The clause is difficult; and a marginal gloss, instead of helping to solve the difficulty, adds to it. The gloss reads, *Lākin* (not *Lākinnahu*, as with Woepcke) *shai'un (shai'an?) ba'da shai'in minha*, instead of *Lākinnahu matā ba'ada* (not instead of *Lākinnahu matā ba'ada 'an wāḥidin minha*, as with Woepke). The meaning to be attached to this is obscure, to say the least; it can only be conjectured that it should mean that one thing after another of these last things returns and becomes the image of the psychic ratios. "Naturally" gives the Arabic *Min til-qā'i ṭabī'atin*, i. e., from, for, or on the part of any nature, *Min til-qā'i* meaning the same as *Min 'indi*, or *Min qibali*, or *Min ladun*. *Ya'ud* might be read instead of *Ba'ada*, i. e. "Whenever it turns back from anyone of these ratios" (W. p. 9, ll. 14—15).

59 The clause is again obscure. The meaning of the Arabic phrase, *Min al-rās ilā ghairihi* is not clear. I suspect that some Greek phrase such as ἐς πόδας ἐκ κεφαλῆς is the basis of the Arabic. The meaning of the sentence as a whole is, however, doubtless that given above. The last things are those furthest removed from their psychic prototypes, things almost devoid of form or limit. Even these, however, are subject to the ratios that govern their psychic prototypes, can never indeed, change or lose these. There is a limit, therefore, beyond which they cannot go, since, then, they would lose these ratios and change

their nature. They can only return whence they came. The Platonic doctrine of the harmony of the world (cf. the Timaeus) and the Neo-Platonic doctrine of the return of all things to their source give a basis for the solution of the passage.

[60] So stands the text of this sentence, which has apparently a metaphysical signifance. Things irrational are divided into three classes.
(1) Irrational powers, as, e, g., the two psychic powers, anger and desire, (cf. the citation from Proclus in note 54 above).
(2) Infinite series of things, as, e, g., species.
(3) Not-being, τὸ μὴ ὄν, i. e., Matter (ὕλη) or Space (χώρα) which has not yet received any form, is still formless (ἄμορφον) or without shape (ἀχηματικον) (cf. *Timaeus* 50b—52c; Arist., *Met.*, W. D. Ross, Vol. 1, Comm. p. 170), forms probably being conceived of as mathematical figures in this instance, concerning which idea see the *Timaeus* 53c. and ZELLER's *Pre-Socratic Philosophy* (Trans., S. F. ALLEYNE, 1881), Vol. 1, p. 436, on Philolaus (W. p. 9, l. 17—p. 10, l. 2).

[61] As in the case of apotomes, for example. Harmonic proportion is such that the difference between the middle term and the first is to the first as the difference between the middle term and the last is to the last.

[62] As in the case of the binomials, for example. The arithmetical mean separates three or more terms by the same term, but with irrationals this term is an unknown quantity.

[63] As in the case of the medials, for example. The geometric mean unites three or more terms by the same ratio. Mathematically the paragraph informs us that there are three kinds of irrationals, and that to each kind one of the three means pertains. See Part 11, para. 17ff., where the author shows how the three kinds of irrationals are produced by the three kinds of proportion.

[64] Or, "Those who have influenced speculation", reading *Al-Mu'tharīna* or *Al-Mu'aththirīna* (W. p. 10, l. 6).

[65] See *Theaetetus*, 147d.—148b. For the Greek cf. J. L. HEIBERG, *Euclidis Elementa*, Vol. V, pp. 450—452, no. 62.

[66] See Appendix A for a discussion of the use of the term, *Quwwah* (power = square) in paragraphs X & XI (W. p. 10, l. 10). Sometimes it would have been more convenient and practical to translate "powers" (= square-roots), the point being that $\sqrt{5}$ and $\sqrt{3}$, e. g., are incommensurable with 1 (= $\sqrt{1}$) in length, whereas $\sqrt{4}$ is commensurable. But the use of "Quwwatun" (= power) throughout paras. 10 and 11 proves that it means square and square only; and the awkwardness of

the argument will be excused, it is hoped, for the sake of its historical accuracy.

[67] Whose lineal measurement is, therefore, a foot. Cf. Appendix A.

[68] That is, conceptual knowledge dealing with forms or genera which are not subject to change, and knowledge of which is, therefore, by its very nature real knowledge. I read *Al-Muntabih* not *Al-Mutanabbih* (W. p. 10, l. 11).

[69] *Theaetetus*, 147e.—148a.

[70] The Arabic is an exact rendering of the Greek ἴσον ἰσάκις, *Al-Mutasāwiyan mirāran mutasāwiyatan* (W. p. 10, l. 12).

[71] That is, they form the number into a square figure as in the problem of the quadrature of a circle. Cf. Appendix A on *Rabba'a*. If "Quwwatun" is taken as "power" (= square-root), then "Rabba'a (to square) must be translated, "Whose square is", and so throughout wherever this change is made.

[72] There is no mention of the fact referred to in this last clause in *Theaetetus*, but it is a pet idea of the commentator. G. J.

[73] Cf. Book X, prop. 9. I read with Suter *Abadan* not *Aiḍan* (W. p. 10, l. 19).

[74] See note 11 of this Part for the meaning of "Qawl".

[75] Or, "The definition that determines these "powers" (squares) by means of the square numbers is different altogether from that which makes them have to one-another the ratio of a square number to a square number".

[76] That is, the ratio of 9 to 4, the halves of 18 and 8.

[77] I have adopted the reading of the MS. Woepcke preferred the supralinear gloss. (see text and notes on the text.) (W. p. 11, ll. 7—8, note 5.)

[78] As Suter says (p. 22, note 62), the definition of Theaetetus was not universally valid, whereas that of Euclid was.

[79] *Theaetetus*, 147d. And in the next clause it is evident that Theaetetus must be the subject of the verb, *explains*, since the reference is to 148a.—b. (W. p. 11, l. 13).

[80] The Arabic is a free rendering of the Greek of *Theaetetus* 148a.—b. I have taken the *Ha* of *Annahā ṭulun* and of *Annahā qiwan* as referring to the *Sides (Al-Aḍlā'u)*, although the form of the sentence would lead one to suppose that it referred to the antecedent of *Allatī*, i. e. *Power* or *Powers (quwwatun* or *qiwan)*. But if the Greek on which the Arabic is based, is taken into account, the antecedent of *Allatī* would be some phrase equivalent to ὅσαι μὲν γραμμαί. The fact, then, that in the

Greek the subject of discussion is the *lines* or *sides of the squares*, points to *sides (Al-Aḍlā'u)* as the most probable antecedent to *Hā* (W. p. 11, ll. 14—15).

[61] That is, the sides of squares commensurable in square but not in length.

[62] That is, as the side of a square.

[63] That is, the squares upon these *powers (surds)* are commensurable with the squares upon the lines called *lengths*. SUTER omits this sentence: the Greek behind it is evidently [συμμετρος] τοῖς δ'ἐπιπέδοις ἁ δύνανται *Theaetetus* 148b. *Length* and *power* here denote, as SUTER says, rational and irrational respectively (W. p. 11, l. 17).

[64] That is, as SUTER says, the squares of 18 square feet and of 8 square feet mentioned in the previous paragraph, 10.

[65] Cf. the previous note, 34, on the meaning of *Al-'adad*. SUTER's note, 65, rests on a misconception, due to his not recognising the real meaning of *Al-'adad* and its use in the sense of *Unit of Measurement*. His note 54 also rests on a misconception of the sense of the paragraph. And Pappus had in all probability the same conception of irrationality as Euclid. I have translated the last clause according to the reading of the MS. The marginal gloss given by WOEPCKE would run: "On which these *powers* are [described] (i. e. which are the sides of these squares). The original text adds the important point that these lines are imaginary, so far, that is, as measure is concerned (W. p. 11, l. 21).

[66] SUTER's change of subject *(lines* to *squares)* and the consequent change of *number* to *square number* is unnecessary. The lines are commensurable in length according to Book X, prop. 9, and have, therefore the ratio of a number to a number according to Book X, prop. 5. (W. p. 12, ll. 2—3.) There is a Latin translation of the treatise up to the end of this paragraph in the Paris MS. 7377 A, fol. 68—70b., apparently by GERHARD of Cremona. See STEINSCHNEIDER in Z. D. M. G., Bd. 25, Note 2. (Cf. SUTER, p. 23, note 67.)

[67] PLATO's *De Legibus*, Bk. VII, 817 (end)—820.

[68] Cf. *De Legibus* VII, 819 (STALLBAUM, 1859, Vol. X, Sect. II, p. 379, ll. 1—5). The Arabic, *Wa ba'da hadhihi-l-Ashya'i*, gives the Greek μετὰ δε ταῦτα. In the Arabic, *Bi-l-Ṭab'i* (= Greek φύσει) qualifies *Qabiḥun* (shameful); and it is to be observed that H. MUELLER (1859) and OTTO APELT (1916) both make φύσει to qualify *ludicrous* and not *ignorance*, as most of the commentators do (See JOWETT). WOEPCKE's reading, *Yadḥaku minhu jamī'a* etc., is a marginal reading. The MS. reads *Faḍaḥika minhu bijami'i* etc. *Bijami'i* is certainly correct, although *Jahila* can take the accusative. *Faḍaḥika minhu* is possible, but the *F* may just be a Y thickly written (W. p. 12, ll. 7—9).

89 Cf. *De Legibus* VII, 819d. (STALLBAUM, p. 379, l. 5.) (W. p. 12, ll. 9—10.)

90 For this passage beginning, "For I hold", cf. *De Legibus* 819d. (STALLBAUM, p. 379, ll. 9—12), 820a. (STALLBAUM, p. 381, ll. 1—2), 820b. (STALLBAUM, p. 381, ll. 3—9). SUTER's note 70, is based on a mistranslation. His translation, p. 23, l. 15, would demand instead of *Man taqaddama (yuqaddimu?), Mimman taqaddama min al-Nāsi.* Moreover the verb *Istaḥā* needs a complement, and *Min Ẓanni man taqaddama* etc. is that complement. This phrase is not, therefore, the *Man ẓanna* of SUTER's translation (W. p. 12, ll. 11—12.)

91 According to WOEPCKE and SUTER we have here in the phrase, *Al-Kitābi-l-ma'rūfi b...*, a repetition of a phrase of the preceding sentence, namely, *Al-Kitābi-l-ma'rūfi bi-Thī'ā ṭiṭus*, i. e. "The book that goes by the name of Theaetetus", except that unfortunately the last word is illegible. In my opinion, however, the last word of the phrase is undoubtedly *Thabatan*, an accusative of respect modifying *Qīla*, i. e., "From what has been said by way of support or demonstration in the .... book". The complement of *Al-ma'rūf* has, therefore, either been omitted, or *Al-ma'rūf* is used here absolutely with the meaning of *Mashhūr*, i. e., *Well-known, Standard* (Cf. Lane's Arabic Dict., I. V, p. 2017, col. I). The latter supposition finds support in the fact that Euclid was generally known to his successors as *The* Στοιχειωτής simply, and that they took a knowledge of his works for granted (Cf. M. CANTOR, *Vorlesungen über Geschichte der Mathematik*, 3rd Ed., 1907, p. 261, the reference to Archimedes, *De sphaera et Cylindro* (Ed. HEIBERG, I. 24), also J. L. HEIBERG, *Litterargeschichtliche Studien über Euclid*, Leipzig, 1882, p. 29 (foot) and his reference to Proclus). The propositions in Euclid referred to are evidently 15 and 36 of Book X. (W. p. 12, l. 20.)

92 Or, "Applied to one-another".

93 *Parmenides* 140c.

94 *Parmenides* 140b., c., d. *Al-Wad'u* is the Greek ἡ ὑπόθεσις of Parmenides 136, for example. SUTER's note 73 is based on a false rendering of *Al-Wad'u*. *Al-Mawdi'u* also is quite correct and means *case* as translated above (W. p. 13, l. 6).

95 That is, the three ideas are interdependent.

96 The Greek words behind *Al-Ijtimā'u* (union) and *Al-Iftirāqu* (separation) are probably ἡ σύγκρισις and ἡ διάκρισις as used, e. g., in Aristotle's *Metaph.*, 988b. 32—35, cf. Plato's use of συγκρίνεσθαι and διακρίνεσθαι in *Parmenides* 156b. The sensible world is the

product of union and division, which are themselves the results of the movements of the circles of the same and the other in the World-Soul. Cf. *Timaeus* 36c.—37c and the commentary of Proclus on the Timaeus, E. DIEHL, Vol. II, p. 158, ll. 18—19, p. 252ff. (W. p. 13, l. 9).

97 That is, the World Soul of *Timaeus* 34b. c., 36c. d. e., 40b., which through the revolutions of the circles of the same and the other controlls the world. Observe the use of κράτος in 36c. for the sense of the Arabic word *qawā* (controlls). Cf. also the commentary of Proclus, E. DIEHL, Vol. I, p. 414, l. 13, where the soul is said to be ἀνακυκλοῦσαν τὸ πᾶν; cf. also Vol. II, p. 286, l. 21, p. 292, l. 10ff., p. 316 ll. 24—25 (W. p. 13, l. 9).

98 *Al-ʿadad* is the reading of the MS. *Al-Qadr* is a marginal reading to be taken in the sense of *measure*, not *will*, as SUTER supposes, *number* being *that which measures* in this case. *Divine number* is the Platonic *separate numbers*, conceived of as separate substances and first causes of existing things (See Arist., *Metaph.*, 1080a. 12—b. 33, 1090a. 2ff., 987b. 31). All things are, therefore, commensurable by divine number, since it is their formal cause. But matter is also necessary for their existence; and it is indefinite; therefore they can be incommensurable (W. p. 13, l. 10).

99 Matter is here conceived of Platonically. It is the *Indefinite Dyad* (Cf. Arist., *Metaph.*, 1081a. 14; cf. also 1083b., 34), or *The Great and Small* (Cf. Arist. *Metaph.*, 987b. 20; cf. also 1085a. 9), which as the material principle of sensibles is, as the *Timaeus* clearly enough says (52a.), space not yet determined by any particular figure and capable of indefinite increase and indefinite diminution.

100 *Limit* is the Platonic τὸ πέρας. It is imposed on matter, *the unlimited* (τὸ ἄπειρον), by the Ideas or the divine numbers.

101 Cf. Arist. *Metaph.*, 1—9, esp. 8; Z. 1034b. 20—1035b. 31, esp. 1035a. 25. The Arabic words translated, *Part, Whole, Matter, Form, Potentiality, Actuality*, give the Greek words, μέρος, ὅλον, ὕλη, εἶδος, δύναμις, ἐνέργεια. (W. p. 13, l. 18).

102 See W. D. ROSS, *Aristotle's Metaphysics*, Vol. II, p. 199 (note to 1036a. 9—10). "The words, ὕλη νοητή", says Mr. Ross in part, "occur only here and in 1037a. 4, and 1045a. 34, 36. Here it is something which exists in individuals (1037a. 1, 2), in non-sensible individuals (1036b. 35) or in sensible individuals not regarded as sensible (1036a. 11), and the only instances given of these individuals are mathematical figures (1036a. 4, 12; 1037a. 2). It seems to be equivalent to ἡ τῶν μαθηματικῶν ὕλη of K 1059b. 15. ALEXANDER, there-

fore, indentifies it with extension (510. 3, 514. 27), which is satisfactory for Z (1036). But in H (1045a) it is the generic element in a definition and, therefore, (1) is present in the nature of a species, and (2) has no limitation to mathematical objects. The instance given in H is a mathematical one: "Plane figure is the ὕλη νοητή of the circle". So ὕλη νοητή in its widest conception is the thinkable generic element which is involved both in species and in individuals, and of which they are specifications and individualizations". "Matter" says Mr. Ross again (Vol. II, p. 195 to 1036a. 8), "is sensible and (changeable), or else intelligible, viz., the matter which exists in sensibles not qua sensible, i. e. mathematical figures". (W. p. 14, l. 1—l. 5) Cf. The Commentary of Proclus on Book I of Euclid, ed., FRIEDLEIN, p. 51, l. 13ff.; p. 57, l. 9ff.

103 *Rasmun*, meaning *Line*, is unusual. *Khaṭṭun* is the common word. *Rasmun* means usually *Mark, Sign, Trace, Impression*. But undoubtedly *Rasmun, Shaklun*, and *Ḥajmun* give here the Greek γραμμή, ἐπίπεδος, and σῶμα, and to be observed is the fact that *Rasmun* and γραμμή correspond in several of their meanings, e. g., *Writing, Drawing*, or *Sketching*. It might mean a mathematical diagram, but that is the meaning of *Shaklun*. Perhaps the three terms represent the μῆκος, ἐπίπεδος, ὄγκος of] Arist., *Metaph.* M 1085a. ll. 10—12. Then *Rasmun* would give μῆκος (W. p. 14, l. 5).

104 Cf. W. D. Ross, *Aristotle's Metaphysics*, Vol. II, p. 199, note to 1036a. 9—10 (towards the end). "It is evident", says Mr. Ross, "from line 11 that in Aristotle's view everything which has sensible matter has intelligible matter, but not vice-versa. We get a scale of matters, each of which implies all that precedes: (1) ὕλη νοητή; (2) ὕλη αἰσθητή including, (a) ὕλη κινητή (τοπική), (b) ὕλη ἀλλοιωτή, (c) ὕλη αὐξητὴ καὶ φθιτή, (d) ὕλη γεννητὴ καὶ φθαρτή, which is ὕλη μάλιστα καὶ κυρίως (*De Gen. et. Corr.*, 320a. 2).

105 That is, sensible and mathematical numbers, which in the Platonic system follow the ideas (the incorporeal life), are free from incommensurability no less than the ideal numbers which precede the ideas (L. ROBIN, *La Théorie platonicienne des Idées et des Nombres d'après Aristote*, Paris, 1908, p. 470), or are identical with them (W. D. Ross, *Arist., Metaph.* Vol. I, Introd., p. LXVI). They possess only limit and form (W. p. 14, ll. 6—8).

106 That is, from the incorporeal life, the ideal world, the Plotinian τὸ ἐκεῖ.

107 E. g., Length, breadth, and thickness (W. p. 14, l. 8).

108 The MS. reading, *The lines which have* etc., is correct, and not the marginal reading, *The line which etc.*, as WOEPCKE suggests. This may be seen from the fact that the author in the next sentence but one speaks of *measures*. Cf. also para. 5, near the middle, where it is asserted that one may assume a line a cubit long, or a line a span long, or some line or other, to be the rational unit of measurement (W. p. 14, l. 12).

109 Cf. note 28 of Part I. of the translation for this sense of *Qadr* (W. p. 14, l. 14).

110 Cf. para. 5, near the middle (W. p. 6, ll. 10—13), (W. p. 14, l. 14).

111 That is, the rationality or irrationality of a magnitude depends upon the given rational unit of measurement. Cf. note 34 of this Part of the translation for the meaning of *'adad*. It is *number* as *measure* (W. p. 14, l. 15).

112 The marginal reading, adopted by WOEPCKE, *Muhaṣṣalatun* might mean *determinate*, as in para. 3, near the end. In all probability, however, it is a gloss on the MS. reading, *Mujmalatun*, meaning *general*, in the sense that the properties sum up the species of rationals and irrationals (W. p. 14, l. 18).

113 That is, presumably, Euclid. The marginal reading which WOEPCKE adopts, *Al-'ilmi*, would run, *"Of his science."* On *La*, as marking the apodosis of a conditional sentence, cf. Wright's *Arabic Grammar* 3rd Ed., Vol. II, p. 349A (W. p. 14, last line).

114 That is, it can be measured by some unit of measurement or other (W. p. 15, l. 2).

115 As SUTER says, this means that some line or other must be taken as the rational unit of measurement (W. p. 15, l. 3).

116 That is, the subject and predicate of the previous clause-viz., "*Every line which is commensurable*", i. e., *commensurable and rational*; as may be seen from the next two sentences. The Arabic runs literally: "And let the one of the two of them be convertible into the other". I read, of course, *Ya'kasu*, and not *Bi-l-'aksi*, as WOEPCKE. I read also *Yusamma* and *Yuda'u*, and not *Nusammi* and *Nadi' u*. (W. p. 15, ll. 6—7).

117 Cf. Book X, Definitions 3 & 4.

118 Commensurable, that is, in length or in square; since lines are said to be commensurable in length, although not commensurable with the assumed line. See the end of this paragraph and the succeeding one.

119 Literally, "Is a something added to them from without". But the Arabic phrase, *Min khārijin*, probably gives some such Greek phrase as ἐκτὸς τόυτων (ἐκτός?, ἔξω?), meaning, *besides* (praeterquam), as in Plato's *Gorgias*, 474d. The Commentator means that in the two phrases, *rational lines commensurable in length* and *rational lines commensurable in square, commensurable in length* and *commensurable in square* do not modify the idea, *rational line*, i. e., as the next clause says, do not refer to the proportion of the lines to the assumed rational line, but modify the idea, *line*, i. e., refer to the proportion of the lines to one-another (W. p. 15, ll. 14—15).

120 Since lines can be rational and commensurable in length, although not commensurable with the assumed rational line in length. See the end of this paragraph and the next paragraph.

121 Cf. note 34 of Part I of the Translation for the meaning of *Al- adad* The unit of measurement in this case is $\sqrt{2}$.

122 Woepcke omits the phrase, *Yaqdiru-l-khaṭṭa-l-mafrūḍa aiḍan*, from the text of the MS. at this point, since it is impossible that this measure ($\sqrt{2}$) should "measure the assumed line also". Perhaps we should read "*Biqadri-l-khaṭṭi* etc", meaning, "With the measure of an assumed line also" (W. p. 16, l. 4, note 3).

123 Literally, "There is not anything, then, which makes a rational except commensurability with the assumed rational line". Suter's notes 84 & 85 rest on a misapprehension of the meaning of the text. Pappus had undoubtedly the same conception of rationality as Euclid, as has already been pointed out in note 85 above (W. p. 16, l. 1ff.).

124 Euclid, Book X, prop. 19.

125 In short, "What ratio they have to the rational line", or, "What is the mode of their relation to the rational line".

126 But not commensurable in length with the given rational line. The Arabic is slightly involved in this sentence. But observe that the Arabic, *Amma*.................*amma*, renders the Greek μὲν..... ...δὲ. Cf. Wright's *Arabic Grammar*,' 3rd Ed., Vol. I, p. 292B (W. p. 16, ll. 9—12).

127 Book X, prop. 19 and Definition 4.

128 That is, if you multiply the length by the breadth.

129 Literally, "Then the area of the rectangle must be six *somethings-or-other*. But what the six somethings-or-other are, is not known".

130 As Suter says (Appendix 3), the lines containing the rectangle would be, e. g., $3\sqrt[4]{2}$ and $2\sqrt[4]{2}$, which are commensurable in length, but the product of which is $6\sqrt{2}$, a medial, irrational rectangle.

131 Not very clear, as already Suter has observed. G. J.

132 Cf. *Theaetetus*, 148a.; i. e. μῆκος. (W. p. 17, l. 15).

133 Cf. *Theaetetus*, 148a. b.; i. e. δύναμις. (W. p. 17, l. 16).

134 That is, to explain the use of the name 'power' (square) for these lines.

135 Cf. *Theaetetus*, 148b.

136 That is, in length or in square.

137 That is, the lines commensurable with this other measure but incommensurable with the first.

138 The MS. reading is "*Wahuwa la yash'iru*". The meaning is that Euclid without giving notice of the basis of his procedure, named these lines rational on the ground that they were commensurable with the given line in square, and named them commensurable in length on the ground that they had a common measure, although that measure was not the given line (W. p. 18, l. 2).

139 Which they are not, according to definition. See Definition 3, Book X. Suter's note 94 rests on a misapprehension of the text (W. p. 18, l. 3).

140 Cf. the previous paragraph towards the end.

141 Suter remarks (Appendix 4): This last proposition is not wholly correct. If, for example, the given rational line is 10 and the two lines containing the area 5 and $\sqrt{3}$, the area, $5\sqrt{3}$, is medial, but one of the sides, 5, is commensurable with the given rational line, 10. That is, both sides need not be incommensurable with the given line in length.

142 Suter supposes (note 96) that this sentence should stand at the end of the paragraph, or else that the rest of the paragraph is a later addition. The latter supposition seems to him the more likely, since what comes hereafter is to him self-evident, even naive. It is, however, pertinent, if somewhat tautologous. The commentator points out in this paragraph that rational lines are; —

(1) commensurable in length with the given line and therefore with one-another.

(2) commensurable in square only with the given line. Of these
   (a) some are commensurable with one-another in length, but not with the given line,
   (b) others are commensurable in square only with the given line and with each other.

Therefore in this last part of the paragraph he points out that if it be stated that an area is contained by two lines rational and commensurable in square only, this means that the two rational lines are commensurable with one-another and with the given rational line in square only Etc. (See Translation.)

143 WOEPCKE' conjecture that the reading should be "*In square only*" and not "*In length only*" is correct. The use of *only* determines the use of *square* (W. p. 18, last line, note 6).

144 Cf. Book X, props. 21 & 22; J. L. HEIBERG, *Euclidis Elementa*, Vol. V, p. 488, no. 146; p. 489, no. 150. On the paragraph cf. ibid., p. 485, ll. 8—16.

145 Book X, prop. 21. That this clause seems to repeat the previous clause, is due to the exigences of translation. The former clause translated literally would run somewhat as follows: "And, therefore, can have a square described on it equal in area to the rectangle etc. "The use of *Janbatun* (Side) is unusual. The ordinary word for side is *Ḍil'un*. The dual of *Janbatun* may emphasize the fact that the sides are adjacent sides. The two lines are, of course, the extremes, τὰ ἄκρα, but this in Arabic is *Ṭarafāni* (W. p. 19, l. 7).

146 Cf. J. L. HEIBERG, *Euclidis Elementa*, Vol. V, p. 485, ll. 8—9; p. 491, no. 158, for the Greek of this clause. *Juz'iyyatun* (Particular) is an adjective qualifying *Ṭabī'atun* (nature or species), not a noun as SUTER takes it. *'alā ṭabī'atin juz'iyyatin* gives the Greek ἐπὶ μερικωτέρας φύσεως (W. p. 19, ll. 7—8).

147 That is, the rectangle contained by two rational lines commensurable in square only.

148 Cf. Book X, Def. 3. As this definition shows, this phrase includes not only the square upon the line but all areas which are equal to the square upon the line.

149 Cf. for this paragraph J. L. HEIBERG, *Euclidis Elementa*, Vol. V, p. 485, l. 16—p. 486, l. 7. Cf. also para. 4 above in the translation. As SUTER says (note 98), this resemblance is nowhere expressly stated in Euclid. The short lemma before proposition 24 does not carry the comparison so far as Pappus does here. Pappus seems to have based his comparison on props. 21—25.

150 See Book X, prop. 23, Porism; props. 24 and 19.

151 See Book X, prop. 25.

152 Cf. SUTER, Appendix 6, who gives the following examples of these areas in the order of the text: (1) $\sqrt{3}\,.\,\sqrt{5} = \sqrt{15}$, (2) $2\sqrt[4]{5}\,.\,3\sqrt[4]{5} = 6\sqrt{5} = \sqrt{180}$, (3) $\sqrt[4]{20}\,.\,\sqrt[4]{45} = \sqrt[4]{900} = \sqrt{30}$; (1) $3\,.\,5 = 15$, or $\sqrt{18}\,.\,\sqrt{8} = 12$, (2) $\sqrt[4]{27}\,.\,\sqrt[4]{48} = \sqrt[4]{1296} = 6$.

153 The Greek of this sentence is given in J. L. HEIBERG's *Euclidis Elementa*, Vol. V, p. 485, ll. 23—25: — καὶ ἔοικεν ἡ μὲν τῶν μήκει συμμέτρων μέσων ἀνάλογον μεταξὺ ληφθεῖσα καὶ ἡ τῶν δυνάμει συμμέτρων ῥητῶν ἐκ παντὼς ἔιναι μέση. (W. p. 20, l. 5).

154 WOEPCKE's emendation of the text is correct, as may be seen from the context. We must read "*Commensurable in square,*" not "*Commensurable in length.*" The error occure, however, in the Greek text, cf. J. L. HEIBERG's *Euclidis Elementa* Vol. V, p. 485, ll. 25—27: — ἡ δὲ τῶν ῥητῶν μήκει συμμέτρων τότε μὲν ῥητή, τότε δὲ μέση. — The Arab translator probably did not notice the error and translated mechanically (W. p. 20, l. 8).

155 That is, the two rationals or the two medials commensurable in square.

156 The Greek is given in J. L. HEIBERG, *Euclidis Elementa*, Vol. V, p. 486, ll. 3—6: — αἰτιατέον οὖν τὴν ἀναλογίαν τῆς τῶν περιεχομένων χωρίων διαφορᾶς τὴν μεταξὺ τῶν ἄκρων etc. — The primary meaning of *Ikhtilāṭun* is *Mixture, Confusion*, but here it renders the Greek ἡ διαφορά. Cf. *Khiltun*, meaning *Kind, Species* (DOZY, *Supplément*, Vol. 1, p. 394, col. 1). *Al-Ṭarafāni* is the technical Arabic term for the *extremes* and does not mean, as SUTER supposes, the length and breadth of the area, although they are here that also. The Greek gives only the first and last of the three types of means given by the Arabic text (W. p. 20, ll. 12—13).

157 Cf. Book X, props. 1—18 (20). Cf. Para. 4 above (W. p. 5).

158 Cf. Book X, props. 36ff., 73ff.

159 Cf. Book X, prop. 36.

160 Cf. Para. 4 above near the middle (W. p. 5, l. 7).

161 Cf. Book X, prop. 73.

162 That is, with the minuendus. G. J.

163 SUTER quite rightly remarks (note 103): "Clearer would have been the expression, "And the diagonal of the square described on the rational line". WOEPCKE, however, (*Extrait du Tome XIV des Mémoires présentés .... à l'Academie des Sciences de l'Institut imperal de France* Essai d'une Restitution de Travaux perdus d'Apollonius, p. 37, note 1) takes the diagonal as a in his example. The side is, then, as SUTER says, $=\sqrt{\frac{a^2}{2}}$. WOEPCKE also points out that the Arabic word translated, *diagonal*, also means *diameter*, and shows how this meaning of the word might be interpreted geometrically. But the meaning, *diagonal*, gives the simpler and the better idea (W. p. 21, l. 5).

164 SUTER says (Appendix 7): According to WOEPCKE the three lines are, the medial line $=\sqrt{a\sqrt{\frac{a^2}{2}}}$, the binomial $=a+\sqrt{\frac{a^2}{2}}$, the apotome $=a-\sqrt{\frac{a^2}{2}}$; but in my opinion they are, the medial line $=\sqrt{a\sqrt{2a^2}}$,

the binomial $= \sqrt{2a^2} + a$, the apotome $= \sqrt{2a^2} - a$. — Both conceptions are justified, so far as Euclid's definitions are concerned.

[165] a) WOEPCKE's conjecture that *irrationality (Asammu)* must be supplied is undoubtedly correct; cf. Book X, prop. 37 and the next paragraph (W. p. 21, l. 12).

b) That $a + \sqrt{b} + \sqrt{c}$ is not "rational", $= \sqrt{d}$, can be proved as follows. It would follow that $a + \sqrt{b} = \sqrt{d} - \sqrt{c}$, i. e., a binomial would be equal to an apotome, which according to Euclid X, 111, is impossible. G. J.

[166] WOEPCKE's conjecture, *"One of them" (Aḥaduhā)*, instead of *"One of the two of them" (Aḥaduhumā)* is supported by the reading of the text later in the paragraph (W. p. 22, l. 9). "Again, let there be three medial lines commensurable in square, such that one of them *(Aḥaduhā)*". The following *Ma'a* may have caused the intrusion of the *M* between the *H* and the *A* (W. p. 21, l. 21).

[167] The Arabic is *Majmū'a-l-murabba'i*, i. e., *the sum of the square [areas] that is produced by the two of them.* — But the reference is to prop. 39 of Book X, and the phrase is best rendered into English by *"The sum of the squares on them."* Cf. note 190 for this and "synonymous" Arabic phrases. SUTER thinks that Pappus applied this extension wrongly to irrationals which he had not discussed. But this is only a question of method of treatment (W. p. 21, l. 21).

[168] Cf. Book X, props. 40 and 41.

[169] a) "Namely, the first bimedial .... irrational", may be a gloss. The paragraph is most concise in statement and omits many steps in the argument. See prop. 37, Book X (W. p. 22, ll. 10—11).

b) The previous sentence presupposes something impossible. Three medials commensurable in square are of the form $\sqrt{a}\sqrt[4]{m}$, $\sqrt{b}\sqrt[4]{m}$, $\sqrt{c}\sqrt[4]{m}$. If now each with either of the remaining two form a rational rectangle, the product of the first two is rational, viz. $\sqrt{abm} = r$, Likewise $\sqrt{acm} = r_2$; $\sqrt{bcm} = r_3$. The three multiplied together give $abcm\sqrt{m} = r, r_2 r_3$. That is, a square root is equal to a rational number, which is nonsense. G. J.

[170] That is, binomials, bimedials etc. On the mathematical implications of the paragraph see WOEPCKE's *Essai*, notes to pp. 37—42; T. L. Heath's *"The Thirteen Books of Euclid's Elements"* (1908), Vol. III, pp. 255—258.

[171] Cf. Book X, props. 73—78.

172 Or, "Which is to be cut off", taking the participle in its gerundial sense and the clause in a general sense.

173 a) On the "Annex" cf. T. L. Heath's "*The Thirteen Books of Euclid's Elements*" (1908), Vol. III, p. 159. The Greek is ἡ προσαρμόζουσα. The Arabic *(Al-Lifqu)* means *To join and sew together the two oblong pieces of cloth of a garment*, i. e. in its primary sense (W. p. 22, last line).

b) *Annex* or ἡ προσαρμόζουσα is = *Subtrahendus*. Euclid's apotome, a—b, is formed from two rational lines. If from the subtrahendus, b, something be subtracted, c, a new apotome arises, a — (b — c). The difficulty mentioned by Woepcke (Essai p. 43 = 700) is thus resolved. G. J.

174 That is, the annex of the apotome last arrived at.

175 That is, not only apotomes but also first and second apotomes of a medial, minors etc. can be produced by the same method of subtraction.

176 Compound lines are those formed by addition.

177 Suter adds logically enough in his translation, "And irrationals".

178 *Jumlatun* means a *part* or a *chapter* of a book (See Dozy, *Supplément*, Vol. 1, p. 219, col. 1), not a *Class* in this case, as Suter translates it (W. p. 23, l. 10).

179 Book X, prop. 1.

180 Book X, prop. 2.

181 Cf. Book X, props. 3—9, esp. 5—9; cf. also props. 11 & 14.

182 Cf. Book X, prop. 10, and Definitions 1 & 2. That is, the incommensurability of lines may be based upon their lineal measurements only or upon their lineal and square measurements. Suter translates, "In square only", taking *"In length"* *(Fī-l-ṭūli)* in the second case to be an error for *„In square*" (With reference to the square: *Fī-l-Quwwati)* (W. p. 23, l. 14).

183 Cf. props. 15—18. The "*Them*" are the commensurable and incommensurable continuous quantities.

184 Prop. 16 of our Euclid is manifestly referred to in the previous clause; cf. the previous note. Cf. J. L. Heiberg, *Euclidis Elementa*, Vol. V, p. 484, ll. 8—10.

185 *Dhakara* here gives the Greek διδάσκει (J. L. Heiberg, *Euclidis Elementa*, Vol. V, p. 484, l. 13), and later, para. 30, first line, it renders the Greek διαλέγεται δεικνύων (Ibid, p. 547, l. 24). "*To Discuss*" has much the same connotation (W. p. 23, l. 17).

186 Props. 19—26. Prop. 21 is referred to in the phrase, "The production of it" or "The finding of it" The *Annahā* after the third *Dhakara* of this paragraph may be an interpolation. The Greek has nothing

corresponding to it (J. L. HEIBERG, Ibid., p. 484, ll. 11—15; no. 133, esp. l. 14) (W. p. 23, l. 18).

187 Prop. 10 of our Euclid. Cf. the lemma to prop. 18, and Heath's note to prop. 10 (Vol. III, p. 32).

188 Prop. 21.

189 Props. 27 & 28 respectively. For the first clause cf. J. L. HEIBERG, *Euclidis Elementa*, Vol. V, p. 501, no. 189 (cf. p. 503, ll. 3—4).

190 The reference is to prop. 33. The Greek is τὸ μὲν συγκείμενον ἐκ τῶν ἀπ' αὐτῶν τετραγώνων. For this the Arabic uses several phrases: *Majmūʿu-l-Murabbaʿi-l-kāʾini minhumā* (para. 22); *Al-Murabbaʿu-lladhi minhumā maʿan* (para. 26, twice); *Al-Murabbaʿu* (Same paragraph, a line later, but manifestly depending for its sense on the previous phrase; *Al-Murabbaʿu-l-murakkabu min murabbaʿaihimā* (para. 27); *Al-Murabbaʿu-lladhi min murabbaʿaihimā* (para. 27); *Al-Murabbaʿu-lladhi minhumā* (para. 27) This last phrase is shown by its context to be identical in meaning with the two previous phrases and thus proves that all the phrases given here have one and the same meaning (W. p. 25, l. 5).

191 Book X, props. 33—35 respectively. SUTER (note 111) gives as examples, $\sqrt{8 + \sqrt{32}}$ and $\sqrt{8 - \sqrt{32}}$; both are incommensurable in square; the sum of their squares is rational (16); their product medial ($\sqrt{32} = 4\sqrt{2}$).

192 Book X, props. 36—41.

193 That is, the binomial, prop. 36.

194 That is, the first and second bimedials, props. 37 and 38.

195 That is, the major, the side of a rational plus a medial area, and the side of the sum of two medial areas. These two lines are not qualified as either rational or medial. Cf. paragraph 25, where they are described as "Neither rationals nor medials". The reference is to props. 39—41. WOEPCKE's conjecture is, therefore, correct. We must read "Incommensurable in square" and not "Commensurable in length". The error is probably a copyist's mistake. The phrase, "*Commensurable in length*" occurs in the MS. directly above on the previous line and again two lines before at the end of the line (W. p. 24, ll. 19—20).

196 That is, in the previous paragraph, 26: "And two straight lines, neither medial nor rational, but incommensurable in square, which make the sum of the squares upon them rational, but the rectangle contained by them medial etc.".

[197] And, therefore, irrational. The two last clauses might be translated as follows: — "Two because of the two medials etc.; and one because of the two rationals etc.". But the preposition, *Min*, can hardly convey both the sense given it in the translation and that given it in this note, as in SUTER's translation, even if, ultimately, such is the meaning to be attached to the text (W. p. 24, ll. 21—22).

[198] Book X, props. 36—38 & 39—41 respectively.

[199] The phrase, *Fi kulli wāḥidi min hadhihi* (in the case of each one of these), translated above: "In the case of the three latter propositions", refers evidently to props. 39—41, in which these irrationals are formed from lines incommensurable in square (W. p. 25, l. 3).

[200] a) The text is incorrect. It should run: — "The whole line would be medial". Proof: —

$x^2 + y^2 = \sqrt{a}$, i. e., the sum of the squares is medial.

$xy = n\sqrt{a}$, i. e., the rectangle is medial and commensurable with $\sqrt{a}$.

$$x^2 + 2xy + y^2 = \sqrt{a}\,(1 + 2n).$$

The whole line $x + y = \sqrt{\sqrt{a}}\,.\,\sqrt{1 + 2n}$ = medial.

$$x - y = \sqrt{\sqrt{a}}\,.\,\sqrt{1 - 2n} = \text{medial.}$$

$x = \frac{1}{2}\sqrt{\sqrt{a}}\;(\sqrt{1 + 2n} + \sqrt{1 - 2n})$ = 2nd bimedial.

$y = \frac{1}{2}\sqrt{\sqrt{a}}\;(\sqrt{1 + 2n} - \sqrt{1 - 2n})$ = 2nd apotome of a medial; x and y are not commensurable in length. G. J.

b) This is undoubtedly, however, the text of the MS., and there is no just reason for supposing a scribal error. The only question is whether the error is one of translation or a slip of the original author.

[201] Book X, props. 42—47.

[202] The Arabic word, *Maʿa*, usually meaning "*With*" "*Along with*" probably renders here the Greek μετά ("After") (W. p. 25, l. 15).

[203] Book X, prop. 48.

[204] Props. 48—53. Cf. for these two sentences J. L. HEIBERG, *Euclidis Elementa*, Vol. V, p. 534, no. 290. The Arabic phrase, *Wa huwa muṣarrafun ʿala sittati anḥāʾin*, gives the Greek ἑξαχῶς διαποικιλλομένην (W. p. 25, l. 16).

[205] The *Hu* (it) in *Istaʿaddahu* (he provided it (these)) refers back to the *Hu* (it) in *Faʿalahu* (he did it (this)), which refers back to *Amrun*,

which is the finding of the six binomials. In the next clause *Alladhi* and *'alaihi* (by means of which) also refer back ultimately to *Amrun.* I have, therefore, translated the *Hu* in *Ista'addahu* by "*These*" for the sake of clarity (W. p. 25, ll. 16—17).

206 That is, that the squares upon these six irrationals formed by addition are equal to the rectangle contained by a rational line and one of the six binomials respectively.

207 Book X, props. 54, 55, 56—59.

208 For this paragraph cf. J. L. HEIBERG, *Euclidis Elementa,* Vol. V, p. 538, no. 309.

209 Book X, props. 66—70.

210 Book X, props. 60—65. SUTER has not grasped the meaning of the text. The Greek runs (J. L. HEIBERG, etc., p. 547, l. 23—p. 548, l. 5 for the paragraph, and for the last sentence, p. 548, ll. 2—5): — καὶ ἔτι τὰς δυνάμεις ἀυτῶν παρὰ τὰς ῥητὰς παραβάλλων ἐπισκέπτεται τὰ πλάτη τῶν χωρίων ἀντίστροφον ἑτέραν ἑξάδα τῇ ἐν τῷ $\bar{s}$ κεφαλαίῳ παραδοθείσῃ ταύτην εὑρών. — The Arabic does not say that these propositions belong to part seven. As a matter of fact they form the first group mentioned in part eight. Did propositions 60—65 come after propositions 66—70 in Euclid? (W. p. 26, ll. 6—7).

211 Book X, props. 60—65. Cf. the previous note.

212 Book X, props. 71—72. WOEPCKE omits the phrase, *Allati li-ba'dihā 'inda ba'din,* given in the MS., without comment. It is true that this phrase is not necessary in the Arabic for the sense of the clause. But it gives the Greek: — ἣν ἔχουσιν ἁι κατὰ σύνθεσιν ἄλογοι πρὸς ἀλλήλας —, which is represented, therefore, in the Arabic not only by the status constructus, but also by this clause. For the paragraph in the Greek cf. J. L. HEIBERG, *Euclidis Elcmenta,* Vol. V, p. 551, no. 353; for the clause cited, ibid., l. 23 (W. p. 26, l. 11, note 2).

213 Book X, props. 73—78.

214 Cf. Part II of the translation, para. 12, towards the end and the note on *Naẓīr* given there. Cf. also the following paras., 13, 14, and 15.

215 WOEPCKE's conjecture is unnecessary. The meaning of the Arabic phrase, *Fī-l-Tarkībi,* is quite clear (W. p. 26, l. 20, note 5).

216 I think that it would be better to adopt the marginal reading, *Fī-,* and translate the clause in full as above (W. p. 26, l. 21, note 6).

217 Book X, props. 79—84. On *annex* cf. note 173 above. For the paragraph in the Greek cf. J. L. HEIBERG, *Euclidis Elementa,* Vol. V, p. 553, no. 359.

218 Book X, props. 85—90. Cf. para. 27 above. The Arabic has the singular, "The binomial was found" (W. p. 27, l. 1).

[219] Book X, props. 91—96.

[220] Book X, props. 103—107.

[221] Book X, props. 97—102. That is, the squares on the various irrationals applied to a rational line give as breadths the various apotomes.

[222] Book X, prop. 111, first part.

[223] Book X, prop. 111, second part.

[224] Book X, props. 108—110. Cf. para. 30 above.

[225] Book X, prop. 115.

[226] Literally, "Abandoning irrationality, on the ground that it proceeds without end". Cf. paragraph 4, above, (end): — "*Wa taraka-l-Naẓara fī-l-ṣummi li-khurūjihā ilā mā lā nihāyata*". "*Tamurru bila nihāyatin*" is a circumstantial clause (a *maf'ūlun li-ajlihi)* giving the reason for the relinquishing of the investigation. Observe that props. 112—114 are not referred to at all. But cf. note 4 above (W. p. 27, l. 18).

PART II

Book II of the commentary on the tenth book of Euclid's treatise on the elements[1]. Ms. 31 v.°

§ 1. The following is, in short, what should be known concerning the classification of the irrationals. In the first place Euclid explains to us the ordered [irrationals], which are homogeneous with the rationals. Some irrationals are unordered, belonging to the sphere of matter, which is called the *Destitute*[2] (i. e., lacking quality or form), and proceeding ad infinitum; whereas others are ordered, in some degree comprehensible, and related to the former (i. e., the unordered) as the rationals are to themselves (i. e., the ordered). Euclid concerned himself solely with the ordered [irrationals], which are homogeneous with the rationals and do not deviate much [in nature] from these. Apollonius, on the other hand, applied himself to the unordered, which differ from the rationals considerably. Page 29.

§ 2. In the second place it should be known that the irrationals are found in three ways, either by proportion, or addition, or division (i. e., subtraction[3]), and that they are not found in any other way, the unordered being derived from the ordered in these [three] ways only. Euclid found only one irrational line by proportion, six by addition, and six by subtraction; and these form the sum total of the ordered irrationals[4]. Page 30.

§ 3. In the third place we should examine all the irrationals with respect to the areas to which the squares upon them are equal, and observe every distinction between them with respect to these [areas], and investigate to which of the areas the squares upon each one of them are [respectively] equal, when these [areas] are "parts" (or "terms")[5], and to which the squares upon them are equal, only when these [areas] are "wholes"[6]. In this way we find that the square upon the medial [line] is equal to a rectangle contained by two rational lines commensurable in square, and each of the others we treat in like manner. Accordingly he (i. e., Euclid) also describes the application of the squares [upon them to a rational line] in the case of each one of them and finds the breadths of these areas[7]. Whereupon, zealous to make his subject clear, he adds together the areas themselves, producing the irrationals that are formed by addition[8]. For when he adds together a rational and a medial area, four irrational lines arise; and when he adds together two medial areas, the remaining two lines arise. These lines, therefore, are also named *compound lines* with reference to the adding together of the areas; and those that are formed by subtraction are likewise named *apotomes* (or *remainders)*[9] with regard to the subtraction of the areas to which the squares upon them are equal[10]; and the medial is also called *medial*, because the square upon it is equal to the area (or rectangle) contained by two rational lines commensurable in square [only][11].

§ 4. Having advanced and established[12] these facts, we should then point out that every rectangle is contained either by two rational lines, or by two irrational lines, or by a rational and an irrational line; and that if the two lines containing the rectangle
Page 31. be rational, then they are either commensurable in length or commensurable in square only, but that if they be both irrational, then they are either commensurable in length (i. e., with one-another), or commensurable in square only (i. e., with one-another), or incommensurable in length and square, and, finally, that if one be rational and the other irrational, then they are both necessarily incommensurable. If the two rational lines containing the given rectangle are commensurable in length, the rectangle is rational, as the Geometer (i. e., Euclid) proves-, viz.: — "The rectangle contained by two rational lines commensurable in length is rational"[13]; if they are commensurable

in square only, the rectangle is irrational and is called *medial*, and the line the square upon which is equal to it, is medial, a proposition which the Geometer also proves-, viz: — "The rectangle contained by two rational lines commensurable in square only is irrational, and the line the square upon which is equal to it, is irrational: let it be [called] *medial*[14]". If the two lines containing the rectangle are, on the other hand, irrational, Ms. 32 r.º
the rectangle can be either rational or irrational. For if the two lines are commensurable in length (i. e., with one another), the rectangle is necessarily irrational, as he (i. e., the Geometer, Euclid) proves in the case of medial lines[15], which method of proof applies to all irrationals. But if the two lines are commensurable in square only (i. e., with one-another), the rectangle can be rational or irrational; for he shows that the rectangle contained by two medial lines commensurable in square [only] is either rational or irrational[16]. And, finally, if the two lines are wholly incommensurable (i. e., in length and square), the rectangle contained by them is either rational or irrational. For he finds two straight lines incommensurable in square containing a rational [rectangle][17]; and he finds likewise two others containing a medial [rectangle][18]; and the two lines (i. e., in each case) are incommensurable in square, which is what is meant by lines being wholly incommensurable, since lines incommensurable in square are necessarily incommensurable in length also[19].

§ 5. Thus he finds by geometric proportion that the medial line has described upon it a square equal to a medial rectangle, Page 32.
which rectangle is equal to that contained by two rational lines commensurable in square. That is his reason for calling it[20] by this name.

§ 6. The six irrationals that are formed by addition[21] are explained by means of the addition of the areas to which the squares upon them are equal, which areas can be rational or medial[22]. For just as we find the medial line by means of the rationals alone, so we find the irrational lines that are formed by addition, by means of the two former, i. e., the rationals and medials, since the irrationals that are nearer [in nature][23] to the rationals, should always yield to us the principles of the knowledge of those that are [in nature] more remote[24]. Thus the lines that are formed by subtraction, are also found only by means of the lines that are formed by addition[25]: but we will discuss these later. The lines that are formed by addition, however, are found by taking two straight lines. Two straight lines must be either commensurable in length, or commensurable in square only, or incommensurable in square and length[26]. If they are commensurable in length, they cannot be employed to find any of the remaining irrationals[2] . For the whole line that is composed of two lines commensurable in length, is like in kind (or order) to the two lines which have been added together[28]. If, therefore, they are rational, their sum is also rational; and if they are medial, it is medial. For when two commensurable continuous quantities are added together, their sum is commensurable with each of them; and that which is commensurable with a rational, is rational, and that which is commensurable with a medial, is medial[29].

§ 7. The two lines, therefore, that are added together, must be necessarily either commensurable in square only, or incommensurable in square and length. In the first place let them be commensurable in square: and to begin with let us imagine the possible cases[30] and point out that either the sum of their squares is rational and the rectangle contained by them medial, or both of these are medial, or, again, the sum of their squares is medial and the rectangle contained by them rational, or both of these are rational. But if both of them be rational, the whole line is rational[31]. Let them both (i. e., the sum of the squares and the
Page 33. rectangle) be rational, and let us apply to the rational line AB the rectangle AC equal to the square upon the whole line LN and let us cut off from it (AC) the rectangle AF equal to the sum of the squares upon LM and MN, so that the remaining

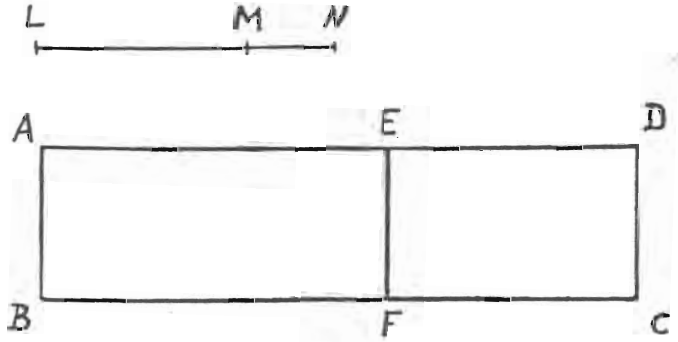

Fig. 1.

rectangle FD is equal to twice the rectangle contained by LM and MN. Then because both the rectangles applied to the rational line AB are rational, therefore both the lines, AE and ED, are rational and commensurable with the line AB in length and, therefore, with one-another. The whole line AD is, therefore, commensurable with both of them and with the line AB; and, therefore, the rectangle AC is rational. The square upon LN is, therefore, of necessity also rational. Therefore the line LN is rational. We must not, therefore, assume both of them, Ms. 32 v.º i. e., the sum of the squares upon LM and MN and the rectangle contained by them, to be rational. — There remain, then, [the three possible cases]: either the sum of the squares upon them is rational and the rectangle contained by them medial, or the converse of this, or both of them are medial. — If the sum of their squares be rational and the rectangle contained by them medial, the whole line is a *binomial*, the square upon it being equal to a rational plus a medial area, where the rational is greater than the medial[32]. For it has already been shown that when a line is divided into two unequal parts, twice the rectangle contained by the two unequal parts is less than the sum of the squares upon them[33]. Conversely, i. e., if the rectangle contained by the two given lines which are commensurable in square only, be rational and the sum of their squares medial, the whole line is irrational, namely, *the first bimedial*, the square upon it being

equal to a rational plus a medial area, where the medial is greater than the rational[34]. If, however, to state the remaining case, both of them, i. e., the sum of their squares and the rectangle contained by them, are medial, the whole line is irrational, namely, *the second bimedial*, the square upon it being equal to
Page 34. two medial areas, these two medial [areas] being, let me add, incommensurable [with one-another][35]. — If they be not so, let them be commensurable [with one-another]. Then the sum of the squares upon LM and MN[36] is commensurable with the rectangle contained by LM and MN. But the sum of the squares upon LM and MN is commensurable with the square upon LM, the square upon LM being commensurable with the square upon MN, since the two lines, LM and MN, were assumed to be commensurable in square, and when two commensurable lines are added together, their sum is commensurable with each of them[37]. The square upon LM, therefore, is commensurable with the rectangle contained by LM and MN. But the ratio of the square upon LM to the rectangle contained by LM and MN is that of the line LM to the line MN. The line LM, therefore, is commensurable with the line MN in length. But this was not granted (i. e., in the hypothesis): they were commensurable in square only[38]. The sum of the squares, therefore, upon LM and MN is necessarily incommensurable with the rectangle contained by these lines. Such, then, are the three irrational lines which are produced when the two given lines are commensurable in square.

§ 8. Three other [lines] are produced when they (i. e., the two given lines) are incommensurable in square. Let LM and MN be incommensurable in square. Then either both the sum of their squares and the rectangle contained by them are rational; or these are both medial; or one of them is rational and the other medial, which gives two alternatives as in the case of the two lines commensurable in square[39]. But if both the sum of the squares upon LM and MN and the rectangle contained by them be rational, the whole line [LN] is rational[40]. — Take the rational

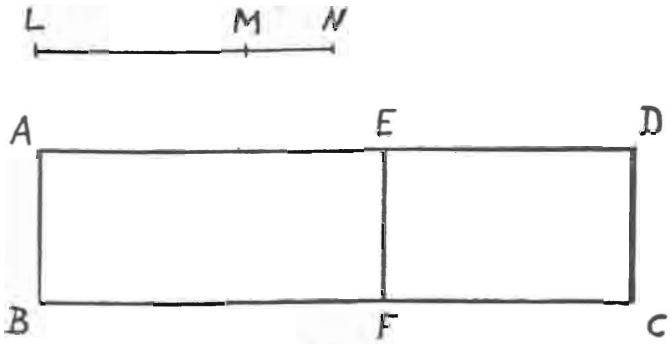

Fig. 2.

line [AB], and let there be applied to it the rectangle [AC] equal to the square upon LN, and let there be cut off from this rectangle [AC] the rectangle AF equal to the sum of the squares upon LM and MN, so that the remaining [rectangle] FD is equal to twice the rectangle contained by LM and MN. AF, then, and FD are rational and have been applied to the rational line AB. Both of them, therefore, produce a breadth rational and commensurable with the line AB. Therefore AE and ED are commensurable [with one-another]; and AD is commensurable with both of them and is, therefore, rational and commensurable Page 35. in length with the line AB. But the rectangle contained by two rational lines commensurable in length is rational[41]. Therefore the rectangle AC is rational. Therefore the square upon LN is rational. Therefore LN is rational; since the line the square upon which is equal to a rational (i. e., is rational), is rational. — Ms. 33 r.° Since, therefore, we desire to prove that the whole line (i. e., LN) is irrational, we must not assume both of the areas (i. e., the sum of the squares upon LM and MN and the rectangle LM·MN) to be rational, but either that both of them are medial, or that one of them is rational and the other medial, which latter instance gives two alternatives. For either the rational [area] or the medial is the greater; since if they were equal [to one-another], they would be commensurable with one-another, and the rational would be a medial and the medial a rational. — If the sum of the squares upon LM and MN be rational, but the rectangle contained by LM and MN medial, let [the whole line] LN be [called] the *major*, since the rational [area] is the greater[42]. Conversely, if the sum of the squares upon LM and MN be medial, but the rectangle contained by LM and MN rational, let LN be [called] the *side of a square equal to a rational plus a medial area*[43], since its name must be derived from both the areas, from the rational, namely, because it is the more excellent in nature, and from the medial, because it is in this case the greater. If, however, both the areas are medial, let the whole line (i. e., LN) be [called] the *side of a square equal to two medial areas*[44]. Euclid in this case also adds in his enunciation that the two medial areas are incommensurable[45].

§ 9. We need not, therefore, conceive of the irrationals that are formed by addition, as [resulting from] the adding together of lines in two ways[46], but rather as [the result of] the adding together in two ways of the areas to which the squares upon these lines (i. e., The six irrationals by addition), are equal[47]. Euclid makes this fact all but clear at the end of this section[48], where he proves that if a rational and a medial area be added together, four irrational lines arise, and that if two medial areas be added together, the two remaining [lines] arise. It is obvious, then, in our opinion, that if the two lines are commensurable in square, of necessity three lines arise; and that if they are incommensurable in square, three [lines also] arise; since it is impossible that
Page 36. they should be commensurable in length. — Enquiry must be made, however, into the reason why when describing the [lines] commensurable in square, he (i. e., Euclid) also mentions their kind (or order), saying, namely, [in the enunciation], "Two rationals commensurable in square or two medials"[49], whereas when positing (or describing) the incommensurable in square, he does not name them rational or medial[50]. He ought, [as a matter of fact], to have given the enunciation in the former cases the same form which it has in the latter, as, for example: — "When

two straight lines commensurable in square [only] which make the sum of the squares upon them medial, but the rectangle contained by them rational[51], be added together, the whole line is irrational: let it be called the first bimedial"; and in like manner [should have been stated the proposition dealing] with the second bimedial. For this is the form of enunciation which he gives in the case of the [lines which are] incommensurable in square, naming them neither medial nor rational, but making such an assumption in the case of the areas only, i. e., the sum of the squares upon these lines and the rectangle contained by them, positing either that both are medial, or that one is rational and the other medial, with either the rational or the medial the greater[52]. — Let me point out, then, that I consider Euclid to assume that when two lines are commensurable in square, the square upon each of the lines is rational, if the sum of the squares upon them is rational, and medial, if the sum of the squares upon them is medial; but that when two lines are incommensurable in square, the square upon each of them is not rational, when the sum of the squares upon them is rational, nor medial, when the sum of the squares upon them is medial. Accordingly when he posits [lines] commensurable in square[53], he names them rational or medial, since lines the squares upon which are equal to a rational area, are rational, and lines the squares upon which are equal to a medial area, are medial. But when he posits [lines] incommensurable in square, there is no basis[54] for his naming them rational or medial, since only lines the squares upon each one of which are equal to a rational area, should be named rational, not those the sum of the squares upon which is rational, but the squares upon which are not [each] rational. For a rational area is not necessarily divided into two rational areas. He names medial also those lines the squares upon which are each equal to a medial area, not those the sum of the squares upon which is medial, but the squares upon which are not [each] medial. For a medial area is not necessarily divided into two medial areas. Page 37. Ms. 33 v.

§ 10. Such was his (i. e., Euclid's) idea. But proof is required of the fact that two lines[55] are rational or medial, when they are commensurable in square and the sum of the squares upon them rational or medial, and that this statement (or enunciation) does not hold concerning them, when they are incommensurable in square. — Let the two lines, LM and MN, be commensurable in square, and let the sum of the squares upon them be rational. I maintain, then, that these two lines are rational. For since the line LM is commensurable with the line MN in square, therefore the square upon LM is commensurable with the square upon MN. Therefore the sum of the squares upon the two of them is commensurable with [the square upon] each of them. But the sum of the squares upon the two of them is rational. Therefore [the square upon] each of them is rational. Therefore the lines, LM and MN, are rational and commensurable in square. — Let, now, the sum of the squares be medial. I maintain, then, that these two lines are medial. For since LM and MN are commensurable in square, therefore the squares upon them are commensurable. Therefore the sum of the squares upon them is commensurable with [the square upon] each one of them. But the sum of the squares is medial. Therefore the squares upon LM and MN are medial. Therefore they (i. e., the two lines, LM and MN) are also medial. For that which is commensurable with a rational, is rational, and that which is commensurable with a medial, is medial; and the line the square upon which is equal to a rational [area], is rational, and the line the square upon which is equal to a medial [area], is medial. If, then, the squares upon LM and MN are medial, their sum (i. e., the line LN) is medial; and if the sum of the squares upon them is medial, then they (i. e., the lines, LM and MN) are medial, since LM and MN are commensurable in square[56]. — Let the two lines, however, be incommensurable in square. I maintain, then, that they are not rational, when the sum of the squares upon them is rational, nor medial, when it (i. e., the sum of the squares) is medial.

Assume this to be possible, and let the squares upon LM and MN be rational, and let there be applied to the rational line AB Page 38. the rectangle AC equal to the sum of the squares upon LM and MN, and let there be cut off from it the rectangle AF equal to the square upon LM, so that the remaining rectangle EC is equal to the square upon MN. Then because the square upon LM is incommensurable with the square upon MN, since these are incommensurable in square, it is obvious that AF is incom-

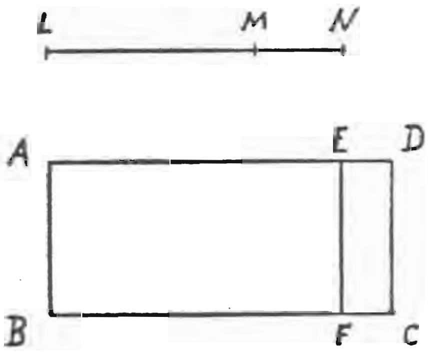

Fig. 3.

mensurable with EC. The line AE, therefore, is incommensurable with the line ED in length. But because the squares upon LM and MN are rational, therefore the rectangles, AF and EC, are rational; and they have been applied to the rational line AB; therefore the lines, AE and ED, are rational and commensurable in square only. But since the rectangle AF is incommensurable with the rectangle EC, therefore the line AE is incommensurable with the line ED in length. The line AD, therefore, is a binomial and, therefore, irrational[57]. But the rectangle AC is rational, since it is equal to the sum of the squares upon LM and MN, which is rational; and it has been applied to the rational line AB. Therefore the line AD is rational. The same line is, therefore, both rational and irrational[58]. The squares upon LM and MN are not, therefore, rational. — Again, let the sum of the squares upon LM and MN, which [lines] are incommensurable

in square, be medial. I maintain, then, that the squares upon LM and MN are not medial. Assume this to be possible, and let AB be rational, but let the same two rectangles (i. e., AF and EC) be [in this case] medial[59]. The lines, AE and ED, are, then, both rational and commensurable in square only[60]. AD, there-
Ms. 34 r.° fore, is a binomial and, therefore, irrational. But it is [also] rational, since the sum of the squares upon LM and MN is medial, and it has been applied to the rational line AB producing a rational breadth (i. e., AD). The squares upon LM and MN are, therefore, not medial. It has been proved, therefore, that two lines incommensurable in square are not also rational or medial, when the sum of the squares upon them is rational or medial[61]. Since, then, Euclid has shown this (i. e., the proposition concerning lines being rational or medial, when the sum of the squares upon them is rational or medial) to be true in the case of [lines] commensurable in square, but not true in the case of [lines] incommensurable in square[62], he names the commensurable in square rational or medial, but does not name the latter so. He names them *incommensurable in square* simply[63].

§ 11. Since, then, [Euclid's] division [of lines] assumes, to
Page 39. begin with, only lines commensurable in square and lines incommensurable in square[64], he finds the irrational lines therewith by adding rational areas with medial areas, or by adding together medial areas which are incommensurable with one-another[65], these two kinds of areas being convenient, inasmuch as they are produced by rational lines. For when the lines containing an area are rational, they are either so (and therefore also commensurable) in length, in which case the area contained by them is rational, or they are so (and therefore also commensurable) in square, in which case the area contained by them is medial[66]. Consequently he finds the six irrationals that are formed by addition, by means of the fact that rational lines contain one [or other] of these two [kinds of] areas. — Let this description which we have given of the irrationals that are formed by addition,

suffice, since we have already shown their order and number with respect to this division (i. e., of lines into those that are commensurable and those that are incommensurable in square)[67].

§ 12. We find the six [irrationals] that are formed by subtraction, by means of those that are formed by addition. For if we consider each one of the irrational lines which we have discussed[68], and treat one of the lines (i. e., one of the terms) of which it is composed, as a whole line and the other as a part of that, then the remainder which is left over from it (i. e., the remainder left after taking the term treated as a part from that one treated as a whole line) constitutes one of these six irrationals[69]. When *the whole straight line and a part of it*[70] produce [by addition] the binomial, [by subtraction] the apotome arises. When they produce [by addition] the first bimedial, [by subtraction] the first apotome of a medial arises. When they produce [by addition] the second bimedial, [by subtraction] the second apotome of a medial arises. When they produce [by addition] the major, [by subtraction] the minor arises. When they produce [by addition] the side of a square equal to a rational plus a medial area, [by subtraction] that (the line) which produces with a rational area a medial whole arises. When they produce [by addition] the side of a square equal to two medial areas, [by subtraction] that which produces with a medial area a medial whole arises. Thus it is clear that the latter [six irrationals] are produced from the former six; that they are their *likes* (or *contraries)*[71]; and that those [irrationals] that are formed by subtraction, are homogeneous with those that are formed by addition, the apotome being homogeneous with the binomial, the first apotome of a medial with the [first] bimedial [the two terms of which, two medial straight lines commensurable in square only,] contain a rational rectangle, the second apotome of a medial with the [second] bimedial [the two terms of which etc.,] contain a medial rectangle, the others being the likes (or contraries) of one-another in like manner. Page 40.

§ 13. That we name the irrationals that are formed by subtraction, *apotomes*[72], only because of the subtraction of a part of the line from the whole [line], need no more be supposed than that we named the six [irrationals] that are formed by addition, *compound lines*, because of the addition of the lines. On the contrary we name them [so] only with respect to the areas that are subtracted and subtracted from, just as we named those irrationals that are formed by addition, *compound lines*,
Ms. 34 v. only with respect to the areas to which, when added together, the squares upon them (i. e., the six irrationals formed by addition) are equal. — — Let the line AB produce with [the line]

Fig. 4.

BC a binomial [73]. Now the squares upon AB and BC are equal to twice the rectangle contained by AB and BC plus the square upon AC[74]. But the sum of the squares upon AB and BC is rational, whereas the rectangle contained by them is medial[75]. Subtracting, then, a medial area (i. e., twice $AB \cdot BC$) from a rational area (i. e., $AB^2 + BC^2$), the line the square upon which is equal to the remaining area (i. e., AC^2), is the apotome (namely, AC)[76]. Consequently just as the binomial can be produced by adding together a medial and a rational [area], where the rational is the greater, so if a medial [area] be subtracted from a rational, the line the square upon which is equal to the remaining [area], is the apotome. We designate the binomial, therefore, *by addition* (or *The line formed by addition)* and the apotome *by subtraction* (or *The line formed by subtraction)*, because in the former case we add together a medial [area], which is the less, and a rational, which is the greater, whereas in the latter case we subtract the very same medial [area] from the very same rational; and because in the former case we find the line the square upon which is equal to the whole [area] (i. e., the sum of the two areas), whereas in the latter case we find the line the square upon which is equal to the remaining [area] (i. e., after subtraction of the medial from the rational). The apotome and the binomial are, therefore, homogeneous, the one being the contrary of the other[77]. — Again if the two lines, AB and BC, are commensurable in square, and the sum of the squares upon them is medial, but the rectangle contained by them rational[78], the medial [area] (i. e., $AB^2 + BC^2$) is equal to twice the rational (i. e., twice $AB \cdot BC$ plus the square upon the remaining line AC). Conversely to the former case, then, subtracting here a rational area (i. e., twice $AB \cdot BC$) from a medial (i. e., $AB^2 + BC^2$), the line the square upon which is equal to the remaining [area] (i. e., AC^2), is the first apotome of a medial (i. e., AC)[79]. Consequently just as we produce the first bimedial by adding a medial [area] with a rational, granted that the rational is the less and the medial the greater, so, we maintain, the first apotome of a medial is the line the square upon which is equal to the remaining [area] after the subtraction of that rational from that medial. — Again if AB and BC produce, [when added together], the second bimedial[80], so that the sum of the squares upon them is medial [and also the rectangle contained by them][81], and the sum of the squares upon AB and BC is greater than twice the rectangle contained by them, by the square upon the line AC[82], subtracting, then, a medial [area] (i. e., twice $AB \cdot BC$) from a medial (i. e., $AB^2 + BC^2$), where the lines containing the medial and subtracted area[83] are commensurable in square, the line the square upon which is equal to the remaining [area] (i. e., AC^2), is the second apotome of a medial[84]. For just as the line the square upon which is equal to these two medial areas when added together, was named the second bimedial, so the line the square upon which is equal to the area which remains after subtraction of the less of the two medial [areas] from the greater, is called the second apotome of a medial. — Again when the two lines, AB and BC, are incommensurable in square, the sum of the squares

Page 41.

upon them rational but the rectangle contained by them medial, subtracting, then, twice the medial area (i. e., twice $AB \cdot BC$) from the rational (i. e., $AB^2 + BC^2$), the square upon AC remains; and it (i. e., the line AC) is named here the minor, just as it was named there (i. e., in the case of the addition of these two areas) the major[85]. For the square upon the latter is equal to the [sum of the] two areas, whereas the square upon the former is equal to the area that remains after subtraction (i. e., of the less of these areas from the greater). Consequently he names the latter the minor, because it is the like (or contrary) of that which he names the major. — Again if the sum of the squares upon AB Ms. 35 r.° and BC be medial, but the rectangle contained by them rational[86], and twice the rational area (i. e., twice $AB \cdot BC$) be subtracted from the medial, which is the sum of the squares upon them (i. e., $AB^2 + BC^2$), then the line the square upon which is equal to the area that remains after subtraction, is the line AC; and it is named the line which produces with a rational area a medial Page 42. whole, since it is obvious that the square upon it plus twice the rectangle contained by the two lines, AB and BC, which is rational, is equal to the sum of the squares upon AB and BC[87]. — Again if the two lines, AB and BC, be incommensurable in square, the sum of the squares upon them and the rectangle contained by them medial but incommensurable with one-another, subtracting, then, twice the rectangle contained by them (i. e., twice $AB \cdot BC$) from the greater medial area, namely, the sum of the squares upon them (i. e., $AB^2 + BC^2$), the line the square upon which is equal to the remaining area (i. e., AC^2), is the line AC; and it is named the line which produces with a medial [area] a medial whole, since the square upon it and twice the rectangle contained by AB and BC are together equal to the sum of the squares upon AB and BC, which is medial[88].

§ 14. If, then, rational areas[89] be added with medial [respectively], or medial areas with one-another, it is clear that the irrational lines the squares upon which are equal to the sum of two such areas, are those which receive their name in view of this addition. But if medial areas be subtracted from rational, or rational from medial, or medial from medial, it is obvious that we have the irrational lines that are formed by subtraction. In the case of the latter areas we do not subtract a rational from a rational, since, then, the remaining area would be rational. For it is evident that a rational exceeds a rational by a rational[90] and that the line the square upon which is equal to a rational area, is rational. If, then, the line the square upon which is equal to the area that remains after subtraction, is to be irrational, and the square upon it to be equal to another area, which from this specification of it is irrational, the *area subtracted* from a rational area cannot be rational. Three possibilities remain, therefore: either to subtract a rational from a medial, or a medial from a rational, or a medial from a medial. But when we subtract a medial area from a rational, the two lines[91] which we produce, the two squares upon which are equal to the two remaining areas, are irrational. For if the two lines containing the medial area are commensurable in square, the apotome arises; but if they are incommensurable in square, the minor arises. And when we subtract a rational area from a medial, we likewise produce two other [irrational] lines. For if the two lines containing the rational and subtracted area are commensurable in square, the first apotome of a medial arises; but if they are incommensurable in square, that which produces with a rational area a medial whole, arises. And, finally, when we subtract a medial area from a medial, if the two lines containing the medial [and subtracted[92]] area are commensurable in square, the line [the square upon which is equal to] the remaining [area] is [the second apotome of a medial; but if they are incommensurable in square], that which produces with a medial area a medial whole, [arises][93]. For, in the case of addition, when we joined medial areas with rational, or rational with medial, or medial with medial, we produced six irrational lines only, [two] in each case[94], whence the method of Page 43.

positing [in the enunciations] the addition of lines containing the less areas, the squares upon which are equal to the greater areas, where we assume the lines in certain cases to be commensurable in square and in others incommensurable in square[95].

§ 15. To sum up. [Firstly], when a medial area is added to a
Ms. 35 v.° rational, the line the square upon which is equal to the sum, is a binomial; when it is subtracted from it, the line the square upon which is equal to the remaining area, is an apotome, granted that it (i. e., the medial area) is contained by two lines commensurable in square[96]. — [Secondly,] when a rational area is added to a medial, the line the square upon which is equal to the sum, is a first bimedial; when it is subtracted from a medial, the line the square upon which is equal to the remaining area, is a first apotome of a medial, granted that it (i. e., the rational area) is contained by two lines commensurable in square[97]. — [Thirdly], when a medial area is added to a medial, the line the square upon which is equal to the sum, is a second bimedial; when it is subtracted from a medial, the line the square upon which is equal to the remaining area, is a second apotome of a medial, granted that it (i. e., the first mentioned medial area) is contained by two lines commensurable in square[98]. — [Fourthly], when a medial area is added to a rational, the line the square upon which is equal to the sum, is a major; when it is subtracted from a rational, the line the square upon which is equal to the remaining area, is a minor, granted that it (i. e., the medial area) is contained by two lines incommensurable in square which make the sum of the squares upon them rational[99]. — [Fiftly,] when a rational area is added to a medial, the line the square upon
Page 44. which is equal to the sum, is the side of a square equal to a rational plus a medial area; when it is subtracted from a medial, the line the square upon which is equal to the remaining area, is the line which produces with a rational area a medial whole, granted that it (i. e., the rational area) is contained by two lines incommensurable in square which make the sum of the squares

upon them medial[100]. — [Sixthly,] when a medial area is added to a medial, the line the square upon which is equal to the sum, is the side of a square equal to two medial areas; when a medial is subtracted from a medial, the line the square upon which is equal to the remaining area, is the line which produces with a medial area a medial whole, granted that the less area itself is contained by two lines incommensurable in square, the sum of the squares upon which is equal to the greater[101]. — The areas may be taken, therefore, in three ways: either a medial is joined with a rational, or a rational with a medial, or a medial with a medial. A rational is never joined with a rational, as has already been shown[102]. The lines containing these areas may be of two kinds: either commensurable in square or incommensurable in square. That they should be commensurable in length is impossible. The areas may be either added together or subtracted from one-another.

§ 16. The irrational lines, therefore, (i. e., those formed by addition and subtraction) are twelve. They are the contraries of one-another: firstly, with respect to the manner in which the areas (i. e., the rationals and medials) are taken, since [,for example,] we sometimes add a medial to a rational, and sometimes we subtract a medial from a rational[103]; secondly, with respect to the lines containing the less areas, the squares upon which are equal to the greater, since these are sometimes commensurable in square and sometimes incommensurable in square[104]; and thirdly, with respect to the areas taking the place of one-another, since, for example, we sometimes subtract a rational from a medial and sometimes a medial from a rational, and sometimes a rational and less area is added to a medial and sometimes a medial and less area is added to a rational[105]. The lines, therefore, that are formed by addition are respectively the contraries of those that are formed by subtraction so far as concerns the manner in which the areas are taken (i. e., whether they are to be added together or subtracted from one-another).

With reference to the lines which contain the less areas, the first three of the lines formed by addition and of those formed by subtraction are respectively the contraries of the following three.
Ms. 36 r.° And with respect to the areas taking the place of one-another,
Page 45. the ordered irrationals are the contraries of one-another taken in threes[106]. Such, according to the judgment of Euclid, is the manner in which the irrationals are classified and ordered.

§ 17. Those who have written concerning these things (i. e., of irrationals), declare that the Athenian, Theaetetus, assumed two lines commensurable in square and proved that if he took between them a line in ratio according to geometric proportion (the geometric mean), then the line named the *medial* was produced, but that if he took [the line] according to harmonic proportion (the harmonic mean), then the *apotome* was produced[107]. We accept these propositions, since Theaetetus enunciated them, but we add thereto, in the first place, that the geometric mean [in question] is [and only is] the mean (or medial) line between two lines rational and commensurable in square[108], whereas the arithmetical mean is one or other of the [irrational] lines that are formed by addition, and the harmonic mean one or other of the [irrational] lines that are formed by subtraction, and, in the second place, that the three kinds of proportion produce all the irrational lines. Euclid has proved

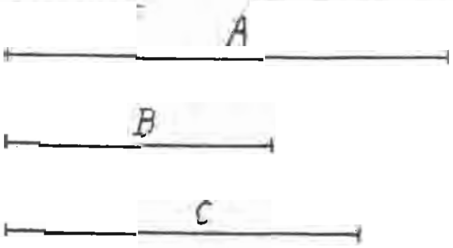

Fig. 5.

quite clearly that when two lines are rational and commensurable in square, and there is taken between them a line proportional to them in geometric proportion (i. e., the geometric mean), then the line so taken is irrational and is named the *medial*[109]. We

will now show the remaining [two kinds of] proportion[110] in the case of the remaining irrationals. — Take two straight lines, A and B, and let C be the arithmetical mean between them. The lines, A and B, when added together, are, then, twice the line C, since this is the special characteristic of arithmetical proportion. If, then, the two lines, A and B, are rational and commensurable in square, the line C is a binomial. For, when added together, they are twice C. But when added together, they produce a binomial. Since, then, the line C is their half [and so commensurable with them][111], therefore this line (i. e., C) is also a binomial. — But if the two lines, A and B, are medial and commensurable in square and contain a rational rectangle, their sum (A + B), which is the double of the line C is a first bimedial. The line C, therefore, is also such, since it is the half of the two extremes (i. e., A and B). — If, however, they (A and B) are Page 46.
medial and commensurable in square and contain a medial rectangle, their sum (A + B) is a second bimedial. It is also commensurable with the line C, since C is its half. Therefore the line C is also a second bimedial. — If, on the other hand, the lines, A and B, are incommensurable in square, and the sum of the squares upon them is rational, but the rectangle contained by them irrational (i. e., medial), the line C is a major. For the sum of the two lines, A and B, is a major; it is also the double of the line C; therefore the line C is a major. — But if, conversely, the two lines, A and B, are incommensurable in square, and the sum of the squares upon them is medial, but the rectangle contained by them rational, the line C is the side of a square equal to a rational plus a medial area. For it is commensurable with the sum of the two lines, A and B; and their sum is the side of a square equal to a rational plus a medial area. — If, however, the two lines, A and B, are incommensurable in square, and both the sum of the squares upon them and the rectangle contained by them are medial, the line C is the side of a square equal to two medial areas. For the sum of the two lines, A and B, is the

double of C and is the side of a square equal to two medial areas. Therefore the line C is the side of a square equal to two medial
Ms. 36 v.º areas. The line C, therefore, when it is the arithmetical mean, produces all the irrational lines that are formed by addition.

§ 18. Let the enunciations [of these propositions], therefore, be stated as follows. — (1). If there be taken a mean (or medial) line between two lines rational and commensurable in square according to arithmetical proportion (i. e., the arithmetical mean), the given line is a binomial. — (2). If there be taken the arithmetical mean[112] between two lines medial, and commensurable in square, and containing a rational rectangle, the given line is a first bimedial. — (3) If there be taken the arithmetical mean between two lines medial, and commensurable in square, and containing a medial rectangle, the given line is a second bimedial. — (4) If there be taken the arithmetical mean between two straight lines incommensurable in square, the sum of the squares upon which is rational, but the rectangle contained by them medial, the given line is irrational and is named the major. —
Page 47. (5) If there be taken the arithmetical mean between two straight lines incommensurable in square, the sum of the squares upon which is medial, but the rectangle contained by them rational, the given line is the side of a square equal to a rational plus a medial area. — (6) If there be taken the arithmetical mean between two straight lines incommensurable in square, the sum of the squares upon which is medial and also the rectangle contained by them, the given line is the side of a square equal to two medial areas. The proof common to all of them[113] is that since the extremes, when added together, are double the mean and produce the required irrationals, therefore these (i. e., the means[114]) are commensurable with one order [or another] of these irrationals.

§ 19. We must now examine how the irrational lines that are formed by subtraction, are produced by the harmonic mean. But first let us state that the special characteristic of harmonic proportion is that the rectangles contained by each of the extremes in conjunction respectively with the mean, are together equal to twice the rectangle contained by the extremes[115], and, in addition, that if one of the two straight lines containing a rational or a medial rectangle be anyone of the irrational lines that are formed by addition, then the other is one of the [irrational] lines that are formed by subtraction, the contrary, namely, of the first[116]. For example, if one of the two lines containing the rectangle be a binomial, the other is an apotome; if it be a first bimedial, the other is a first apotome of a medial; if it be a second bimedial, the other is a second apotome of a medial; if it be a major, the other is a minor; if it be the side of a square equal to a rational plus a medial area, the other is that (i. e., the line) which produces with a rational area a medial whole; and if it be the side of a square equal to two medial areas, the other is that which produces with a medial area a medial whole. — Assuming these propositions for the present[117], let us take the two lines AB and BC, and let BD be the harmonic mean

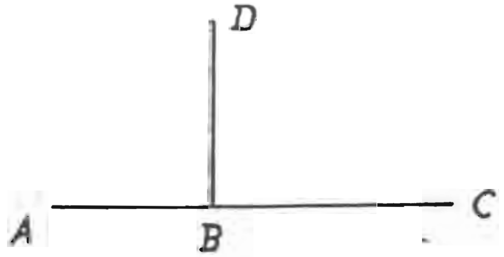

Fig 6.

between them. Then if the two lines, AB and BC, are rational and commensurable in square[118], the rectangle contained by them is medial, and, therefore, twice the rectangle contained by them is medial. But twice the rectangle contained by them is equal to the rectangle contained by the two lines, AB, BD, plus the rectangle contained by the two lines, BC, BD. Therefore the sum of the rectangles contained respectively by AB·BD and BC·BD is also medial. But the sum of the rectangles contained re- Page 48.

spectively by AB·BD and BC·BD is equal to the rectangle
Ms. 37 r.º contained by the whole line AC and the line BD. Therefore the rectangle contained by the two lines, AC and BD, is medial. But it is contained by two straight lines, one of which, AC namely, is a binomial. Therefore the line BD is an apotome. — But if the two lines, AB and BC, be medial, and commensurable in square, and contain a rational rectangle, and we proceed exactly as before, then the rectangle contained by the two lines, AC and BD, is rational. But the line AC is a first bimedial. Therefore the line BD is a first apotome of a medial. — If, however, the two lines, AB and BC, are medial, and commensurable in square, and contain a medial rectangle, then, for exactly the same reasons, the rectangle contained by AC and BD is medial. But the line AC is a second bimedial. Therefore the line BD is a second apotome of a medial. — If, on the other hand, the two lines, AB and BC, are incommensurable in square, and the sum of the squares upon them is rational, but the rectangle contained by them medial, then twice the rectangle contained by them is medial, and, therefore, the rectangle contained by AC and BD is medial. But the line AC is a major. Therefore the line BD is a minor. — But if the two lines, AB and BC, are incommensurable in square, and the sum of the squares upon them is medial, but the rectangle contained by them rational, then the rectangle contained by the two lines, AC and BD, is rational. But the line AC is the side of a square equal to a rational plus a medial area. Therefore the line BD is that (i. e., the line) which produces with a rational area a medial whole. — If, however, the two lines, AB and BC, are incommensurable in square, and both the sum of the squares upon them and the rectangle contained by them are medial, then the rectangle contained by the two lines, AC and BD, is medial. But the line AC is the side of a square equal to two medial areas. Therefore the line BD is that which produces with a medial area a medial whole. When, therefore, the arithmetical mean is taken between

the lines that are added together (i. e., to form the *compound lines)*, one of the irrational lines that are formed by addition (i. e., a *compound line)* is produced; whereas when the harmonic mean is taken, one of the [irrational] lines that are formed by subtraction, is produced; and the latter is the contrary of the line formed by the addition of the given lines.

§ 20. Let the enunciations of these [propositions] be also stated as follows. — (1). If the harmonic mean be taken between two lines which [added together] form a binomial, the given line is an apotome. — (2). If the harmonic mean be taken between two lines which [added together] form a first bimedial, the given line is a first apotome of a medial. — (3). If the harmonic mean be taken between two lines which [added together] form a second bimedial, the given line is a second apotome of a medial. — (4). If the harmonic mean be taken between two lines which [added together] form a major, the given line is a minor. — (5). If the harmonic mean be taken between two lines which [added together] form the side of a square equal to a rational plus a medial area, the given line is that (i. e., the line) which produces with a rational area a medial whole. — (6). If the harmonic mean be taken between two lines which [added together] form the side of a square equal to two medial areas, the given line is that which produces with a medial area a medial whole. The geometric mean, therefore, produces for us the first of the irrational lines, namely, the medial; the arithmetical mean produces for us all the lines that are formed by addition; and the harmonic mean produces for us all the lines that are formed by subtraction. — It is evident, moreover, that the proposition of Theaetetus is hereby verified[119]. For the geometric mean between two lines rational and commensurable in square is a medial line; the arithmetical mean between them is a binomial; and the harmonic mean between them is an apotome[120]. This is the sum and substance of our knowledge concerning the thirteen irrational lines so far as the classification and order of them is concerned

Page 49.

Ms. 37 v.° together with their homogeneity with the three kinds of proportion, which the ancients extolled.

§ 21. But we must now prove by the following method the proposition that if one of the two lines containing a rational or a medial rectangle is anyone of the irrational lines that are formed by addition, then the other is its contrary of the lines that are Page 50. formed by subtraction. Let us first, however, present the following proposition. Let the two lines, AB and BC, contain a rational rectangle, and let AB be greater than BC. On the line AC describe the semicircle ADC, and draw the line BD at

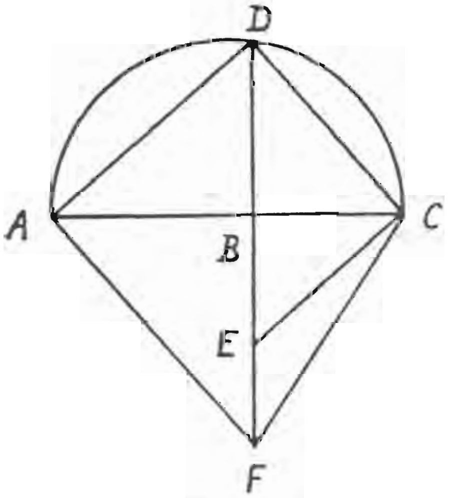

Fig. 7.

right angles [to AC]. The line BD, then, is also rational, since it has been proved that it is a mean proportional between the lines, AB and BC; and if we join DA and DC, the angle at D is a right angle, since it is in a semi-circle. Draw the line AF at right-angles to the line DA; produce the line DB, so that it meets the line AF at the point F; and draw a line at right-angles to DC [at the point, C]. This line, then, I maintain, will not meet the line DF at the point F, nor will it pass outside DF, but touch within it[121]. If possible, let it meet [the line DF] at F. Then the area DAFC is a [rectangular] parallelogram,

since all its angles are right angles. But the line DA is greater than the line DC. Therefore the line CF is greater than the line AF, since the opposite sides [of a parallelogram] are equal. Therefore the squares upon BC and BF ($BC^2 + BF^2$) are greater than the squares upon AB and BF ($AB^2 + BF^2$). Therefore BC is greater than AB; which is contrary (i. e., to the hypothesis), for it was [given as] less than AB. — The following proof would be, however, preferable. Because the angles at A and C are right angles and the lines, AB and BC, perpendiculars [to DF], therefore the rectangle contained by DB and BF is equal to the square upon BC. But it is also equal to the square upon AB. Therefore the square upon AB is equal to the square upon BC. But we have assumed the line AB to be greater than the line BC. — In the same way we can prove that this line (i. e., the line at right-angles to DC,) does not meet DF beyond the point F. — Let it meet DF, therefore, between D and F at the point E. I maintain, then, that the rectangle contained by FB and BE is equal to the square upon DB, which is rational. For DCE is a right-angled triangle, and the line CB a perpendicular [to DE]. Therefore the two triangles (CBE and CBD) are similar triangles (i. e., of the same order). Therefore the angle at E is equal to the angle DCE. But for the very same reason the angle DCB is Page 51.
equal to the angle BDA, and the angle BDA to the angle BAF, since the angles at C, D, and A, are all right angles. Therefore the angle at E is equal to the angle BAF. But the two angles at B (i. e., CBE and ABF) are right angles. Therefore the angles of the triangle BCE are equal [respectively] to those of the triangle BAF. Therefore the ratio of the line BF to the line BA is that of the line BC to the line BE, since they subtend equal angles. Therefore the rectangle contained by FB and BE is equal to the rectangle contained by AB and BC. But the rectangle contained by AB and BC is equal to the square upon DB. Therefore the rectangle contained by FB and BE is rational.

§ 22. Having first proved these propositions, we will now prove what we set out to prove[122]. Let the two lines, AB and
Ms. 38 r.⁰ BC, contain a rational rectangle. Euclid has proved that a rational rectangle applied to a binomial produces as breadth an apotome of the same order as the binomial[123]. If, then, the line AB is a binomial, the line BC is an apotome. If it is a first binomial, BC is a first apotome. If it is a second binomial, BC is a second apotome. If it is a third [binomial], BC is a third [apotome], and so on[124]. Suppose, now, that the line AB is a first bimedial. Proceeding, then, as before[125], we can prove that [the line BC is a first apotome of a medial. For[126]] the line BF is a second binomial, since the square upon a first bimedial applied to a rational line produces as breadth a second binomial. And the line BE is a second apotome, since the rectangle contained by FB·BE is rational, and a rational area applied to a second binomial produces as breadth a second apotome. Therefore the line BC is a first apotome of a medial, since the side of a square equal to an area contained by a rational and a second apotome is a first apotome of a medial. — Let now the line AB be a second bimedial and contain with BC a rational rectangle.
Page 52. I maintain, then, that the line BC is a second apotome of a medial. For proceeding exactly as before, because the line AB is a second bimedial, and the line DB a rational, therefore the line BF is a third binomial, since the square upon a second bimedial applied to a rational straight line produces as breadth a third binomial. And the line BE is a third apotome, since the rectangle contained by FB·BE is rational; and if one of the two lines containing a rational rectangle be a binomial, the other is an apotome of the same order as the binomial. But the line BF is a third binomial. Therefore BE is a third apotome. But the line BD is rational; and the side of a square equal to a rectangle contained by a rational line and a third apotome is a second apotome of a medial; therefore the line BC is a second apotome of a medial, since the rectangle contained by BE·BD is equal

to the square upon BC, the angle at C being a right angle. — Again, let the line AB be a major. I maintain, then, that the line BC is a minor. For proceeding exactly as before, because the line AB is a major, and the line BD rational, therefore the line BF is a fourth binomial, since the square upon a major applied to a rational line produces as breadth a fourth binomial. But the rectangle contained by FB · BE is rational. Therefore the line BE is a fourth apotome, since the line BF is of exactly the same order as the line BE, the rectangle contained by them being rational. Because, then, the line BD is rational and the line BE a fourth apotome, the line BC is a minor, since the side of a square equal to a rectangle contained by a rational and a fourth apotome is a minor. — Again, let the line AB be the side of a square equal to a rational plus a medial area. I maintain, then, that the line BC is that (i. e., the line) which produces with a rational area a medial whole. For proceeding exactly as before, because the line AB is the side of a square equal to a rational plus a medial area, and the line BD rational, therefore the line BF is a fifth binomial, since the square upon the side of a square equal to a rational plus a medial area, when applied to a rational line, produces as breadth a fifth binomial. And because the rectangle contained by FB · BE is rational, Page 53.
therefore the line BE is a fifth apotome. Since, then, the line Ms. 38 v.°
BD is rational, the line BC is that which produces with a rational area a medial whole. For this line is that the square upon which is equal to a rectangle contained by a rational line and a fifth apotome. — Finally let the line AB be the side of a square equal to two medial areas. I maintain, then, that the line BC is that which produces with a medial area a medial whole. For proceeding exactly as before, because the line BD is rational, and the line AB the side of a square equal to two medial areas, therefore the line BF is a sixth binomial. But the rectangle contained by FB · BE is rational. Therefore the line BE is a sixth apotome. But the line BD is rational. Therefore the

square upon BC is the square upon a line which produces with a medial area a medial whole. Therefore BC is that which produces with a medial area a medial whole. — If, therefore, one of the two straight lines containing a rational rectangle be anyone of the irrational lines that are formed by addition, the other is its contrary of the lines that are formed by subtraction. Our discussion has proved this.

§ 23. It will be obvious, moreover, from the following propositions that if one of the two lines containing a medial rectangle be anyone of the irrational lines that are formed by addition,

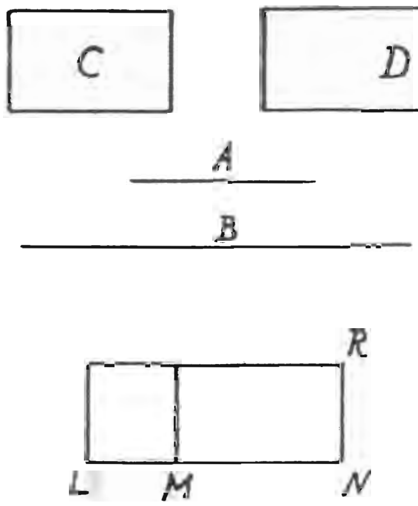

Fig. 8.

then the other is its contrary of those that are formed by subtraction. But first let us present [the proposition] that if the ratio of two straight lines to one-another be that of a rational to a medial rectangle or of two medial rectangles to one-another which are incommensurable with one-another, then the two lines are commensurable in square. — Let the ratio of the line A to the line B be that of the rectangle C to the rectangle D, one of which is rational and the other medial, or both of which are medial but incommensurable with one-another. Let the line NR be rational, and let us apply to it the rectangle RM equal to the rectangle C, and also the rectangle RL equal to the rectangle D. The two lines, MN and NL, are, therefore, rational and commensurable in square, since the two rectangles applied to the rational line (NR) are either rational and medial respectively, or both medial but incommensurable with one-another. Because, then, the ratio of the line MN to the line LN is that of the rectangle RM to the rectangle RL, that is, of the rectangle C to the rectangle D, and the ratio of the rectangle C to the rectangle D is that of the line A to the line B, therefore the ratio of the line MN to the line LN is that of the line A to the line B. But the lines, MN and LN, are commensurable in square. Therefore the line A is commensurable with the line B in square. — Having demonstrated this, let us now proceed to prove what we set out to do, namely, that if one of the two straight lines containing a medial rectangle be anyone of the Page 54.

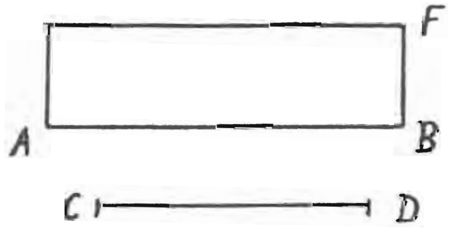

Fig. 9.

irrational lines that are formed by addition, the other is its contrary of the lines that are formed by subtraction. Let the two lines, AB and CD, contain a medial rectangle, and let AB be one of the lines that are formed by addition[127]. I maintain, then, that the other line, CD, is not only one of the lines that are formed by subtraction, but also the contrary of that line (AB). Apply to the line AB a rational rectangle, namely, that contained by AB and BF. The line BF, then, as we have already proved[128], is one of the irrational lines that are formed by subtraction, the contrary, namely, of the line AB, since they contain a rational rectangle. But because the rectangle contained by AB and CD is medial and that contained by AB and BF is rational, therefore

the ratio of the line FB to the line CD is that of a rational to a medial rectangle. Wherefore they are commensurable in square, as we have just proved[129]. Consequently whichever of the irrational lines formed by subtraction the line CD is, the line AB is its like (or contrary)[130], since the line FB is exactly similar (i. e., in order) to CD, the two rectangles to which the squares upon them are equal, being commensurable[131]. Therefore when one of the two straight lines containing either a rational or a medial rectangle is anyone of the irrational lines that are formed by addition, the other is the line which is its like (or contrary) of
Ms. 39 r. those that are formed by subtraction. — Having demonstrated these propositions, it is clear, then, that all the irrational lines that are formed by subtraction, are produced from the lines that
Page 55. are formed by addition by means of harmonic proportion in the manner previously described[132], since we have assumed nothing that cannot be proved.

§ 24. Following our previous discussion, we will now set forth the essential points of difference between the binomials and also between the apotomes, their contraries[133]. The binomials, as also the apotomes, are of six kinds. The reason why they are six in kind is obvious. The greater and less terms of the binomial, namely, are taken, and the squares upon them distinguished. For it is self-evident that the square upon the greater term is greater than the square upon the less either by the square upon a line that is commensurable with the greater, or by the square upon a line that is incommensurable with it[134]. But in the case of the square upon the greater term being greater than the square upon the less by the square upon a line commensurable with the greater, the greater[term], or the less, can be commensurable with the given rational line, or neither of them. Both of them cannot be commensurable with it, since, then, they would be commensurable with one-another, which is impossible. And in the case of the square upon the greater term being greater than the square upon the less by the square upon a line incom-

mensurable with the greater, it follows likewise that the greater term, or the less, can be commensurable with the given rational line, or neither of them. Both of them cannot be commensurable with it for exactly the same reason [as is given above]. There are, therefore, three binomials, when the square upon the greater term is greater than the square upon the less by the square upon a line commensurable with the greater; and there are likewise three, when the square upon the greater term is greater than the square upon the less by the square upon a line incommensurable with the greater. And since we have pointed out that when the ratio of the whole line to one of its [two] parts is that of the [two terms of a] binomial, then the other part of the whole line is an apotome[135], and since it is self-evident that the square upon the whole line is greater than the square upon the first-mentioned part either by the square upon a line that is commensurable with the whole line, or by the square upon a line that is incommensurable with it, and that in both cases either the whole line can be commensurable with the given rational line, or that part of it which has the ratio to it of the [two terms of a] binomial, or Page 56.
neither, but not both, just as in the case of the binomial, therefore necessarily the apotomes are six in kind and are named the first apotome, the second, the third, and so on up to the sixth.

§ 25. By design he (i. e., Euclid) discusses the six apotomes and the six binomials only in order to demonstrate completely the different characteristics of those irrational lines that are formed by addition and those that are formed by subtraction. For he shows that they vary from one-another in two respects, either with regard to the definition of their form[136], or with regard to the breadths of the areas to which the squares upon them are equal, so that the binomial, for example, differs from the first bimedial not only in form, since the former is produced by two rationals commensurable in square and the latter by two medials commensurable in square and containing a rational rectangle, but also in the breadth produced by the application of the areas

of the squares upon them to a rational line. The breadth so produced in the case of the former is a first binomial, in the case of the latter a second binomial. In the case of a second bimedial it is a third binomial; in the case of a major a fourth; in the case of the side of a square equal to a rational plus a medial area, a fifth; and in the case of the side of a square equal to two medial areas, a sixth. The binomials are equal in number to the irrational lines that are formed by addition, each group numbering six, the binomials in order being the six breadths produced by
Ms. 30 v°. applying the areas of [the squares upon] the latter to a rational line, the first in the case of the first, the second in the case of the second, and so on in the same fashion up to the sixth, which is the breadth of the area of the square upon the side of a square equal to two medial areas when applied to a rational line. — In exactly the same way he appends the six apotomes in order to demonstrate the difference between the six irrationals that are formed by subtraction, which is not a mere matter of difference of form alone. For the apotome differs from the first apotome of a medial not only in that it is produced by the subtraction of a
Page 57. line (part) the ratio of which to the whole line from which it is subtracted, is that of the [two terms of a] binomial, whereas the latter is produced by the subtraction of a line the ratio of which to the whole line from which it is subtracted, is that of the [two terms of a] first bimedial, but also in that the square upon an apotome, when applied to a rational line, produces as breadth a first apotome, whereas the square upon a first apotome of a medial produces as breadth a second apotome. And the rest of the lines proceed analogously. The apotomes, therefore, are equal in number to the irrational lines that are formed by subtraction. The squares upon the latter, when applied to a rational line, produce as breadths the six apotomes in order, the square upon the first producing as breadth the first apotome, the square upon the second the second apotome, the square upon the third the third apotome, the square upon the fourth the fourth apo-

tome, the square upon the fifth the fifth apotome, and the square upon the sixth the sixth apotome, the sum total of both kinds [of lines], i. e., of apotomes and of the irrational lines that are formed by subtraction. And they correspond in order, the first with the first, the intermediate with the intermediate, and the last with the last.

§ 26. We should, however, discuss the following propositions. The square upon one of the irrational lines formed by addition produces, when applied to a rational line, one of the binomials as breadth, and the square upon one of the irrational lines formed by subtraction produces, when applied to a rational line, one of the apotomes as breadth; apply now these same squares not to a rational but to a medial line, and it can be shown that the breadths [produced] are first or second bimedials in the case of

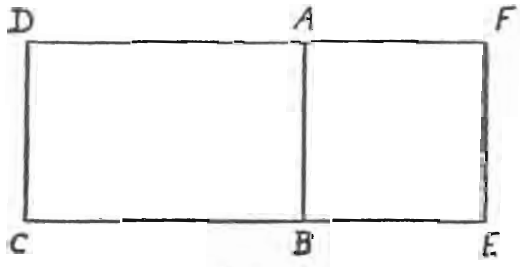

Fig. 10.

[the irrational lines that are formed by] addition, and first or second apotomes of a medial in the case of those lines that are formed by subtraction[137]. We must begin our proof of this, however, [with the following proposition]. If a rational rectangle be applied to a medial line, the breadth [so produced] is medial. Let the rectangle AC be a rational rectangle applied to the medial line AB. I maintain, then, that the line AD is medial. Describe on AB the square ABEF, which is, therefore, medial and has to the rectangle AC the ratio of a medial to a rational area. The ratio of AF to AD is, therefore, that of a medial to a rational area. Therefore the lines, AF and AD, are commen- Page 53.

surable in square. But the square upon AF is medial, since the square upon AB is medial. Therefore the square upon AD is medial. Therefore the line AD is medial.

§ 27. Having first proved this [proposition], I now maintain that if the square upon a binomial or the square upon a major be applied to a medial line, it produces as breadth a first or a second bimedial. Let the line AB be a binomial or a major, the line CD a medial, and the rectangle DG equal to the

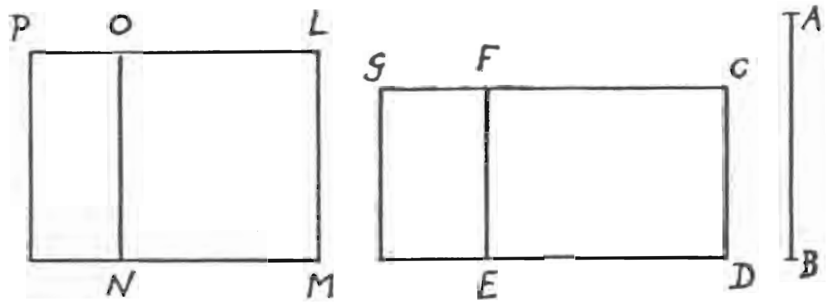

Fig. 11.

square upon AB. Take a rational line LM, and let the rectangle
Ms. 40 r°. MP equal the square upon AB. — If, then, the line AB be a binomial, the line LP is obviously a first binomial[138], but if the line AB be a major, then LP is a fourth binomial[139], as has already been proved with respect to the application of the specified areas[140] to a rational line. Divide LP into its two terms at the point O. Then in the case of both of these binomials (First and fourth) the line LO is commensurable with the given rational line LM, the rectangle MO is rational, and the rectangle PN is medial[141], since the two lines, LM and LO, are commensurable in length, but the two lines, NO and OP, rational and commensurable in square [only]. Cut off [from DG] the rectangle DF equal to the rectangle MO. The remaining rectangle
Page 59. NP[142] is, then, equal to the rectangle EG, since the rectangle DG is equal to the rectangle MP. The rectangle EG is, therefore, medial. — But the rectangle DF is a rational rectangle applied to the medial line CD. The line CF, therefore, is medial,

as has been shown above[143]. And the square upon CD, then, since it is medial, being the square upon the medial line CD, can be regarded (or taken) as either commensurable with the rectangle EG, or incommensurable with it. In the first place let it be commensurable with it. But, then, the ratio of the square upon CD to the rectangle EG is that of the line CD to the line FG, since they have exactly the same height. The line CD is, therefore, commensurable with the line FG in length. The line FG is, therefore, medial. Therefore the lines, CF and FG, are medials. — The rectangle contained by the two lines (i. e., CF and FG) is also, I maintain, rational. For[144] since the line CD is commensurable with the line FG [in length], and the ratio of the line CD to the line FG is that of the rectangle contained by CD and CF to that contained by CF and FG, if, then, you place the two lines, CD and FG, in a straight line, and make the line CF the height, the rectangle DF is commensurable with the rectangle contained by CF and FG[145]. But the rectangle DF is rational. Therefore the rectangle contained by CF and FG is also rational. Therefore the line CG is a first bimedial[146]. — Let now the square upon CD be incommensurable with the rectangle EG. The ratio of the line CD, then, to the line FG is that of a medial area to a medial area incommensurable with it. This will be obvious, if we describe the square upon CD. For the square so described and the rectangle EG have exactly the same height (CD, namely); wherefore their bases, the lines, FG and CD, namely, have to one-another the same ratio exactly as they have, the latter line (i. e., CD) being equal to the base of the area (i. e., the square) described upon it. CD, therefore, is commensurable in square with FG, as has been shown above. The square upon FG, therefore, is medial. Therefore the line FG itself is medial. Therefore the two lines, CF and FG, are medial. — And the rectangle contained by them is, I maintain, medial. For since the rectangle DF is rational, but the rectangle EG medial, therefore the ratio of CF to FG is that of a rational

to a medial area. Therefore CF and FG are commensurable in square, as has already been proved. Since, then, the line CD is incommensurable in length with the line FG, the rectangle
Page 60. DF incommensurable with the rectangle contained by CF and FG, and the rectangle DF rational, therefore the rectangle contained by CF and FG is not rational, and the two lines, CF and FG, are medials commensurable in square only. But the rectangle contained by two medial lines commensurable in square is either rational or medial, as Euclid has proved (Book X, prop. 25). Therefore the rectangle contained by the two lines, CF and FG, since it is not rational, is medial. Therefore the line
Ms. 40 v.° CG is a second bimedial (Book X, prop. 38). When, therefore, the square upon a binomial or the square upon a major is applied to a medial line, it produces as breadth a first or a second bimedial[146].

§ 28. Again let the line AB be either a first bimedial or the side of a square equal to a rational plus a medial area, let the line CD be a medial and apply to it a rectangle (DG) equal to the square upon AB, and let the line LM be rational and the rectangle MP equal to the square upon AB. The line LP is, then, a second binomial, when the line AB is a first bimedial, and a fifth binomial, when the line AB is the side of a square equal to a rational plus a medial area. Divide LP into its two terms at the point O. Then in the case of both of these binomials (namely, the second and the fifth) the line OP is commensurable with the given rational line (i. e., LM); the rectangle NP is rational; and the rectangle MO is medial. Cut off [from DG] the rectangle DF equal to the rectangle MO. The remaining rectangle EG is, then, equal to the rectangle NP. The rectangle DF is, therefore, medial. But the rectangle EG is a rational rectangle applied to the medial line CD. Therefore the line FG is medial. — And since the rectangle DF is a medial rectangle applied to the medial line CD, therefore the square upon CD can be either commensurable with the rectangle DF, or incommensurable with it. In the first place let it be commensurable with it. Then the line CD is commensurable with the line CF. The line CF is, therefore, medial. — And since the line FG is commensurable with the line CD in square [only], but the line CD commensurable with the line CF in length, therefore[147] the line FG is commensurable with the line CF in square [only]. But since the line CD is commensurable with the line CF in length, and the ratio of the line CD to the line CF is that of the rectangle contained by CD and FG to that contained by CF and FG, therefore these [rectangles] are also commensurable[148]. But the rectangle contained by CD and FG is rational, since it is the rectangle EG. Therefore the rectangle contained by CF and FG is rational. Therefore the line CG is a first bimedial. — Let now the square upon CD be incommensurable with the rectangle DF. The ratio, then, of the line CD to the line CF is that of a medial area to a medial area incommensurable with it. The lines, CD and CF, are, therefore, commensurable in square. But the square upon CD is medial. Therefore the line CF is medial. And in the same way as before it can be proved that the line CG is a second bimedial. — If, therefore, the square upon a first bimedial or the side of a square equal to a rational plus a medial area be applied to a medial line, it produces as breadth a first or a second bimedial.

Page 61.

§ 29. Again let the line AB be either of the two remaining lines of the irrationals that are formed by addition, i. e., either a second bimedial or the side of a square equal to two medial areas. Let the line CD be medial, and the line LM rational; and let the same construction be made as before. The line LP, then, is either a third or a sixth binomial, since these are the [only] two that remain; neither of these is commensurable (i. e., in their terms)[149] with the line LM in length; the two rectangles, MO and NP, are medial and incommensurable with one-another; and, therefore, the two rectangles, DF and EG, are also medials. But since the line CD and the two lines, CF and FG, are medial,

Ms. 41 r.° it is also clear that one of them is commensurable with the line CD (i. e., in length), whenever[150] one of the two rectangles, DF or EG, is commensurable with the square upon CD. The rectangle contained by CF and FG is [also], then, commensurable with one of them[151]. Therefore the rectangle contained by CF and FG is medial. The line CG, therefore, is a second bimedial. — But if the square upon CD is not commensurable with either of them (i. e., DF or EG), then neither CF nor FG is commensurable with the line CD. Therefore the rectangle contained by CF and FG is not commensurable vith either of them (i. e., DF or EG), the two lines, CF and FG, are medial lines commensurable in square only, and the rectangle contained by them, therefore, either rational or medial[152]. If, therefore, the square upon a second bimedial or the side of a square equal to two medial areas be
Page 62. applied to a medial line, it produces as breadth either a first or a second bimedial; which fact has already been proved in the case of the other lines[153]. Therefore the square upon each of the [irrational] lines that are formed by addition, when applied to a medial line, produces as breadth a first or a second bimedial.

§ 30. Having dealt with the irrational lines that are formed by addition, let us now consider the irrational lines that are formed by subtraction taken in pairs [as in the case of the former]. Let the line AB be either an apotome or a minor; let the line CD be a medial; and let us describe upon it the rectangle DG equal to the square upon AB. I maintain, then, that the line CG is either a first or a second apotome of a medial. Let the line LM be rational; and let us describe upon it the rectangle MP equal to the square upon AB. The line LP is, then, a first apotome [if the line AB be an apotome], and a fourth apotome if the line AB be a minor. Let the line PO be the *annex* of the line LP, and the rectangle EG equal to the rectangle NP[154]. The ratio, then, of the rectangle MP to the rectangle NP is that of the rectangle DG to the rectangle EG so that the ratio of the line LP to the line PO is that of the line CG to the line FG.

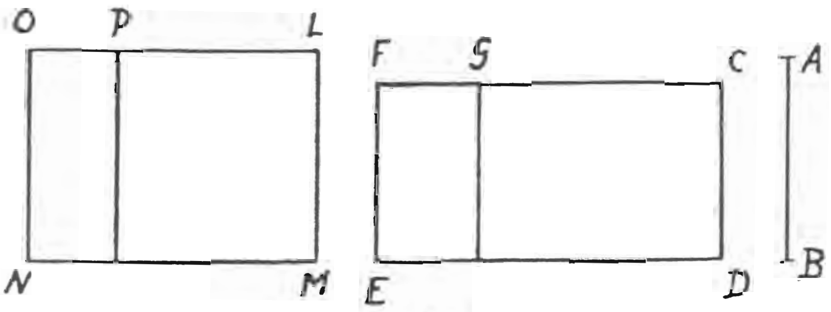

Fig. 12.

But[155] the rectangle MO is rational, since we are dealing with a first or a fourth apotome, so that the line LO is commensurable [in length] with the given rational line LM[156], and the rectangle contained by them, therefore, rational, since they are commensurable in length. The rectangle DF is also, therefore, rational, since it is commensurable with the rectangle MO. But since the rectangle DF is a rational rectangle applied to the medial line CD, therefore the line FC is medial. And because the two lines, LM and PO, are rational lines commensurable in square, since the line LP is either a first or a fourth apotome, Page 63. therefore the rectangle contained by them, NP, is medial. Therefore the rectangle EG is medial. But the square upon CD is also medial. Therefore they (i. e., EG and CD^2) are either commensurable or incommensurable with one-another. — Let them be commensurable with one-another. The line FG is, then, commensurable with the line CD [in length], as we have shown before[157]. Therefore the two lines, FC and FG, are medials. But the three lines, CD, FC and FG, are such that the ratio of the line CD to the line FG is that of the rectangle contained by CD and FC to that contained by FC and FG. These rectangles are, therefore, commensurable. But the rectangle DF is rational. Therefore the rectangle contained by Ms. 41 v.° FC and FG is rational. Therefore the line CG is a first apotome of a medial. — But if the square upon CD is incommensurable with the rectangle EG, then the line FG is not commensurable with the line CD in length, but in square only, since the ratio of CD to FG is that of the medial square upon CD to a medial area incommensurable with it, namely, EG. The square upon FG is, therefore, medial, and FG is, therefore, also medial. But because the line FC is commensurable with the line CD in square, and likewise FG, therefore FC and FG are commensurable with one-another in square. And because the line CD is incommensurable with the line FG in length, and the ratio of the line CD to the line FG is that of the rectangle DF to that contained by FC and FG, therefore[158] these two rectangles are also incommensurable. But the rectangle DF is rational. Therefore the rectangle contained by FC and FG is irrational. But the two lines, FC and FG, are medial lines commensurable in square only. Therefore the rectangle contained by them is medial, since the rectangle contained by two medial lines commensurable in square is either rational or medial. Therefore the line CG is a second apotome of a medial. — If, then, the square upon an apotome or the square upon a minor be applied to a medial line, it produces as breadth a first or a second apotome of a medial.

§ 31. Again let the line AB be either a first apotome of a medial or that [line] which produces with a rational area a medial whole; let the line CD be a medial; and let us describe upon it a rectangle (DG) equal to the square upon AB. I maintain, then, that the line CG is either a first or a second apotome of a medial. For[159] the line LM is rational, and there has been applied to it the rectangle MP equal to the square upon AB. Therefore the
Page 64. line LP is a second or fifth apotome[160]. Let the line OP be the *annex* of LP; complete the rectangle MO; and let the rectangle EG equal the rectangle NP. Then because the line LP is either a second or a fifth apotome, therefore the line OL is a rational line commensurable in square with the given rational line LM, and the line OP is [a rational line] commensurable in length with it[161]. Therefore the rectangle NP is rational, and

the rectangle MO medial, since the former is contained by two rational lines commensurable in length, whereas the latter is contained by two [rational] lines commensurable in square [only]. Therefore the rectangle EG is also rational, but the rectangle DF medial. Because, then, the rectangle EG is a rational rectangle applied to the medial line CD therefore its breadth FG is a medial line commensurable in square [only] with the line CD since a rational rectangle can be contained by medial lines, only if they are commensurable in square[162]. But since the rectangle DF and the square upon CD are medial, they can be either commensurable or incommensurable with one-another. Let them be commensurable with one-another. Then the line CD is commensurable in length with the line FC. Therefore the line FC is also medial. But since the line FG, is commensurable in square with the line CD therefore the lines, FC and FG, are commensurable with one-another in square. But since the ratio of the line CD to the line FC is that of the rectangle contained by the two lines, CD and FG, to that contained by the two lines, FG and FC, if, then, you make the two lines, CD and FC, their bases, and the line FG their height[163], [it is clear that] the rectangle contained by the two lines, CD and FG, is commensurable with that contained by FG and FC. But the rectangle contained by CD and FG is rational. Therefore the rectangle contained by FG and FC is rational. Therefore the line CG is a first apotome of a medial. — But if the square upon CD is incommensurable with the rectangle DF, then the ratio of the line CD to the line FC is that of a medial area to a medial area incommensurable with it. They (i. e., CD and FC) are, therefore, commensurable with one-another in square [only]. The line FC is, therefore, medial. Therefore the two lines, FC and FG, are commensurable with one-another in square [only], since each of them is commensurable with the line CD in square [only]. But because the line CD is incommensurable Ms. 42 r.° with the line FC in length, and the ratio of the line CD to the line FC is that of the rectangle contained by the two lines, CD and FG, to that contained by FG and FC, therefore these two rectangles are also incommensurable with one-another. But the rectangle EG is rational. Therefore the rectangle contained by FC and FG is not rational. But the two lines, FC and FG, are medial lines commensurable in square. Therefore the rectangle contained by them is medial. Therefore the line CG is a second apotome of a medial. If, then, the square upon a first apotome of a medial or the square upon that which produces with a rational area a medial whole, be applied to a medial line, it produces as breadth a first or a second apotome of a medial.

Page 65. § 32. Again let the line AB be one of the two remaining irrational lines, either a second apotome of a medial, or that which produces with a medial area a medial whole; let the line CD be a medial, and the rectangle DG equal to the square upon AB; and let the line LM be rational, and the rectangle, MP equal to the square upon AB. The line LP is, then, either a third or a sixth apotome, according as the line AB is either the third or the sixth of the irrational lines that are formed by subtraction. Let OP be the *annex* of LP, and the rectangle EG equal to the rectangle, NP. Then since the line LP is either a third or a sixth apotome, both of the lines, LO and OP, are incommensurable with the given rational line LM in length, but are rational and commensurable with it in square[164]. Both the rectangles, MO and NP, are, therefore, medial. Therefore both the rectangles, DF and EG, are medial. But since the square upon CD is medial, it is commensurable either with the rectangle DF or with the rectangle EG, or it is incommensurable with both of them. It cannot be commensurable with both of them. For, then, the rectangle DF would be commensurable with the rectangle EG; i. e., the rectangle MO would be commensurable with [the rectangle] NP; i. e., the line LO would be commensurable with the line OP [in length]; but these were given incommensurable in length. — Let the square upon CD be

commensurable with one of the rectangles, DF or EG. Then since both the rectangles, DF and EG, are medial but incommensurable with one-another, therefore the line FC is commensurable with the line FG in square [only]. But since the square upon CD is commensurable with one of the rectangles, DF or EG, the line CD is commensurable with one of the lines, FC or FG, in length. Therefore one of them is medial. But they are commensurable in square. Therefore the other is medial, since the area (i. e., square) that is commensurable with a medial area, is medial, and the side of a square equal to a medial area, medial. The lines, FC and FG, are, therefore, medial lines commensurable in square [only]. But since the rectangle contained by CD and FC is medial, and likewise that contained by CD and FG, therefore the rectangle contained by FC and FG is necessarily commensurable with one of them, since the line CD is commensurable with one of the lines, FC or FG, in length. Therefore the rectangle contained by FC and FG is medial. Therefore the line CG is a second apotome of a medial. — But if the square upon CD is incommensurable with both of the Page 66.
rectangles, DF and EG[165], then the ratio of the line CD to each of the two lines, FC and FG, is that of a medial area to a medial area incommensurable with it. Therefore both the lines, FC and FG, are commensurable with the line CD in square [only]. But because the rectangle DF is incommensurable with the rectangle EG, and the line FC incommensurable with the line FG in length, therefore the two lines, FC and FG, are medial lines commensurable in square [only], and the rectangle contained by them either rational or medial. Therefore the line CG is either a first or a second apotome of a medial. — Our investigation, then, has shown that the squares upon everyone of the irrational lines that are formed by subtraction, produce, Ms. 42 v.°
when applied to medial lines, either a first or a second apotome of a medial, just as the squares upon the irrational lines that are

formed by addition, produce the two lines that are the contraries of these, namely, the first and second bimedial.

§ 33. Various kinds of applications (i. e., of the squares upon irrational lines to a given irrational line) can, however, be made. If, for example, I apply the square upon a medial line to anyone of the lines that are formed by addition, the breadth is one of the lines that are formed by subtraction, the contrary, namely, of the line formed by addition, as we have shown above[166]. And if I apply it to anyone of the lines that are formed by subtraction, the breadth is that line formed by addition which is the contrary of the one formed by subtraction. For if one of the two straight lines containing a medial area, in this case, namely, the [area of a] square upon a medial, be one of the irrational lines that are formed by addition, the other is its contrary of the lines that are formed by subtraction, and conversely, as we have demonstrated before[167]. We can also determine the breadths, if we apply the squares upon the irrationals that are formed by addition to the lines that are formed by subtraction, and conversely, if we apply the squares upon the lines that are formed by subtraction to the lines that are formed by addition. Whenever, then, we make these applications [of squares] to a medial line, or to the lines formed by addition, [or to those formed by subtraction[168]], we find many of the definitions which govern these things (i. e., ultimately, the irrational lines under discussion) and recognize various kinds of propositions[169].

§ 34. We will content ourselves at this point with our dis-
Page 67. cussion, since it is [but] a concise[170] outline of the whole science of irrational lines. For we now know the reason why these applications are necessary, [to show], namely, the commensurabilities (i. e., of the irrationals)[171], and we are also well enough aware of the fact that the irrationals are not only many but infinite in number, the lines formed by addition and by subtraction as well as the medials, as Euclid proved [with respect to the last-mentioned][172], when he established that "from a medial [straight]

line there arise irrational [straight] lines infinite [in number], and none of them is the same as any of the preceeding[173]". But if from a medial line there can arise lines infinite in number, it is obvious to everyone what must be said concerning those that can arise from the rest of the irrationals. It can be affirmed, namely, that there arise from them. infinite times a finite number[174].

§ 35. But we have discussed the irrationals sufficiently. We can investigate by means of the facts that have been presented, any problems that may be set, as, for example: — If a rational and an irrational line be given, which line is the mean proportional[175] between them, and which line the third proportional to them, whether the rational line be taken as the first (i. e., of the two lines) or the second? Each of the irrationals is dealt with, in its turn, analogously. For example, if a rational line and a binomial or an apotome be given, we can find which line is the mean proportional between them, and which is the third proportional to them; and equally so with the rest of the lines. Also if a medial line is given, and then a rational or one of the irrational lines, we can find which line is the mean proportional between them, and which the third proportional to them. For since the breadths produced by the application [of their squares] can be determined[176], and we know that the rectangle contained by the extremes is equal to the square upon the mean, it is easy for us to do this.

The end of the second book and the end of the commentary on the tenth book of the treatise of Euclid; translated by Abū ʿUthmān Al-Dimishqī. The praise is to God. May he bless Muḥammad and his family and keep them. Written by Aḥmad Ibn Muḥammad Ibn ʿAbd Al-Jalīl in Shīrāz in the month, Jumādā 1. of the year 358 H. (= March, 969). Page 68.

NOTES.

[1] The phrase, "In the name of God, the Compassionate, the Merciful", given in the MS., is obviously an addition of the Muslim translator, or, perhaps, of the copyist.

[2] WOEPCKE read *Mu'wiratun*, translating, *Corruptible* (Essai, p. 44, 111, para. 11). SUTER read, *Mu'awwiratun* or *Mu'awwaratun* (note 138), translating, *Corruptible* or *Corrupted* (Vergängliche, Verdorbene). But, in the first place, matter is not conceived of as corruptible or corrupted in Platonism, or Neoplatonism, or even in Neopythagoreanism generally (See the *Timaeus*, 52a.). In the second place, *Mu'wiratun*, or *Mu'awwiratun*, or *Mu'awwaratun*, is applied in this sense only to men as *depraved*, so far as I can find, and even this is a late usage. On the other hand, matter is *Destitute of quality or form* (Cf. Numenius, CCXCV, *Carentem qualitate*: and Plato's *Timaeus*, 50a.—52a., esp. 50e. and 51a. πάντων ἐκτὸς εἰδῶν.), and *Mu'wizatun* means *Needy* or *Destitute* Cf. Part I, para. 2 (end) and para. 3 (W. p. 29, l. 3).

[3] Cf. Part I, para. 9 (beginning).

[4] Cf. J. L. HEIBERG, *Euclidis Elementa*, Vol. V, p. 415, ll. 2—6.

[5] That is, the areas which constitute by addition or subtraction those areas to which the squares upon the irrationals are equal, as in propositions 71—72, 108—110. Literally translated the last clause would run: — "On condition that (or provided that) these areas are parts". The syntax of the Arabic is simple, SUTER's note 140 notwithstanding.

[6] Cf. the previous note. The reference is to propositions 21—22, 54—59, 91—96, where the areas to which the squares upon the irrationals are equal, are not compound areas (W. p. 30, l. 7).

[7] Book X, props. 22, 60—65, 97—102.

[8] Book X, props. 71—72, cf. 108—110. I read *Ka-l-Mujiddi* (like one who is zealous) instead of *Ka-l-Muhiddun?* (W. p. 30, l. 12).

[9] a) *Compound lines* is acceptable; these are the lines that are formed by addition. But *apotomes* is incorrect; for it is spoken about the lines that are formed by subtraction. G. J. See Bemerkungen, page 25.

b) The MS., however, gives *Munfaṣilatun*, which is the regular word throughout for *apotomes*. Either, then, we have an extension of the term, apotome, to include all the irrational lines that are formed by subtraction, or a false or dubious translation of the original Greek term, whatever it was, or an error of the copyist. The term occurs with the same meaning in para. 13 of this Part (beginning). Perhaps, as Dr. JUNGE suggests, we should read *Mufaṣṣalatun* in both cases, which would, then, correspond to *Murakkabatun* (W. p. 30, ll. 15—16).

[10] Book X, props. 108—110.

[11] Book X, prop. 21.

[12] In the *Lisān al-'arab* (Bulaq, 1299—1308 H), Part I, p. 191 (top) *Awṭa'a* is explained as *Overcoming by proof or evidence*, or as *Struggling with and throwing down or making fast*; in this context, therefore, *To establish*. (W. p. 30, l. 19.)

[13] Book X, prop. 19.

[14] Book X, prop. 21.

[15] Book X, prop. 24.

[16] Book X, prop. 25.

[17] a) Book X, prop. 34, cf. prop. 40.

b) It is the line the square upon which is equal to a rational plus a medial area, la_5. See Bemerkungen, p. 25. G. J.

[18] a) Book X, props. 33 & 35; cf. props. 39 & 41.

b) That is, the major, and the line the square upon which is equal to two medial areas; twice two lines. See Bemerkungen, p. 25. G. J.

[19] The last three clauses are somewhat tautological. The commentator, however, wishes to explain the phrase, "Wholly incommensurable".

[20] That is, the line. What SUTER is translating, I do not know. This paragraph is really the conclusion of the previous one and should be included in it. The MS. has no punctuation points after *Ayḍan* (also), but has two dots (thus, :) after *Al-asmi* (name). Cf. Book X, prop. 21 (W. p. 32, l. 2).

[21] See Bemerkungen, page 24. G. J.

[22] Cf. Book X, props. 71 & 72.

[23] Cf. Part I, paras. 21 & 4 (W. p. 20, last line ff. and W. p. 5, l. 7). That is, the medials in this case.

[24] In this case the irrationals formed by addition.

[25] This is not wholly correct. The lines that are formed by addition, are co-ordinate with those that are formed by subtraction. G. J.

[26] a) That is, all the possible cases are given. SUTER has misunderstood the Arabic and omitted the phrase, *commensurable in length*, accordingly (W. p. 32, ll. 9—11).

b) The following lines show that the text means *commensurable with one-another* and not *commensurable with the assumed line*. G. J.

[27] The medial, that is, having already been discussed.

[28] Book X, prop. 15.

[29] Book X, Def. 3 and prop. 23.

[30] According to *The Dictionary of Technical Terms* etc., A. SPRENGER, Vol. II, p. 1219 (foot), *Qismatun* has the same general meaning as *Na'ibun* (Substitute etc.). *Ista'mala* can mean *To feign a thing* (W. p. 32, ll. 18—19).

[31] With modern signs this proposition is very simple. Let the sum of the squares $= a$, twice the rectangle, b, where a and b are rational in the antique (i. e., Euclidian) sense (as also in the modern). The whole line is then $= \sqrt{a + b}$, rational in the antique (Euclidian) sense. G. J.

[32] a) Book X, prop. 71. See Bemerkungen, page 24.

b) Always taking what was stated at the beginning of para. 7 (Part II), as granted, namely, that the lines are commensurable in square with the assumed line and therefore with one-another. G. J.

[33] Book X, prop. 59, Lemma.

[34] Book X, prop. 71. See Bemerkungen, page 24.

[35] Book X, prop. 72. See Bemerkungen, page 24.

[36] Using the same letters, but following the text and figure given both in the MS. and by WOEPCKE, this passage runs: — "Then the sum of the squares upon LN and NM is commensurable with the rectangle contained by LN and NM", and so on throughout. SUTER's reconstruction simplifies the operation and probably represents the true text, since the following proposition in para. 8 (W., p. 34, l. 15) uses the same figure, but gives the lines as LM and MN.

[37] Book X, prop. 15.

[38] Let the line LN $= x + y$, where x^2 has to y^2 the ratio of a number to a number, but x to y not so. Presupposed is $x^2 + y^2$ commensurable with xy. But because x^2 is comm. with y^2, therefore $x^2 + y^2$ is comm. with x^2, and therefore x^2 with xy, or x with y, -which was not granted. G. J.

[39] Cf. Part II, para. 7 (beginning).

[40] Cf. the foregoing figure. The explanation of the following in modern signs is the same as in Note 31 above (Part II). G. J.

[41] Book X, prop. 19.

42 a) Book X, prop. 39.

b) The explanation of the word *Major* in the text is hardly true. $\sqrt{a+\sqrt{b}}$ is, indeed, *Major*, where $a > \sqrt{b}$. But $\sqrt{a-\sqrt{b}}$ is called *Minor*, and here the rational part, a, is also greater than the medial, $\sqrt{b}$. — Cf. NESSELMANN, *Algebra der Griechen*, Berlin 1842, S. 176. G. J.

43 Book X, prop. 40.

44 Book X, prop. 41.

45 Cf. para. 7, above, Part II, towards the end (W., p. 33, last line, to p. 34, l. 1).

46 Cf. Book X, props. 36 to 38 and 39 to 41 respectively. The Arabic says simply, "The two additions of lines", i. e., the addition of lines commensurable in square and the addition of lines incommensurable in square, as in these propositions. The Arabic may be read as either *Tarkībāni ḥuṭūṭin* or *Tarkībāni ḥuṭūṭan* (Cf. de Sacy's Grammar, 2nd Ed., Vol. II, p. 183, and FLEISCHER's *Kl. Schr.*, Vol. I, Teil I, p. 637 on de Sacy). On the use of the dual of the infinitive, cf. FLEISCHER, ibid. p. 633 to de Sacy, II, 175. (W. p. 35, l. 16) (W. p. 35, ll. 16—17).

47 Cf. Book X, props. 71 and 72 respectively, 1) the addition of a rational and a medial area, 2) the addition of two medial areas. Cf. the previous note on the Arabic. (W., p. 35, l. 17).

48 That is, in props. 71 and 72. Therefore *Maqālatun* means here *Section* and not *treatise* (W. p. 35, l. 18).

49 Cf. Book X, props. 36 to 38.

50 Cf. Book X, props. 39 to 41.

51 WOEPCKE's conjecture (p. 36, note 3) is manifestly correct. Cf. Book X, props. 37 and 38.

52 Cf. Book X, props. 39 to 41. SUTER's note (no. 164) is incorrect. The Arabic means *the sum of the squares upon them*; literally it runs: — "The area composed of the sum of the squares upon them", out of which SUTER somehow or other gets *areas*. (W. p. 36, l. 8).

53 As in Book X, props. 36 to 38.

54 I read *Yaḥtajja(i)*, not *Yaḥtaj* (need) (W. p. 36, l. 18).

55 The whole argument of the paragraph shows that Pappus is here referring to the lines. SUTER in note 167 maintains that this is incorrect, and that the reference should be to the squares upon the separate lines. But if the squares upon the lines are rational or medial, so then are the lines; and Pappus may quite well have stated the problem in this way. — See also Bemerkungen p. 30.

56 SUTER omits this last sentence without remark. But the sense is obviously that given above. *Al-Murakkabu minhā* can mean *the compound line* made up of LM and MN as well as the sum of the squares upon them. (W. p. 37, ll. 16—17.)

57 See Bemerkungen, page 24.

58 Which, as SUTER adds, is impossible.

59 That is, so as to curtail the construction, which is obvious from the immediately preceding proposition, viz. —; let LM^2 and MN^2 be medial, and let there be applied to AB a rectangle $= LM^2 + MN^2$, and let there be cut off from it the rectangle $AF = LM^2$, so that $EC = MN^2$. Therefore AF and EC are medial.

70 Because, as SUTER says, two rational lines commensurable in square only form a medial rectangle.

61 Cf. SUTER, note 172, who supposes that in the propositions just given Pappus tries to set up another mode of division for the irrationals of the first hexad (as he puts it).

62 These propositions appear in Euclid implicitly but not explicitly. G. J.

63 That is, without qualification by any such term as rational or medial.

64 Cf. Book X, Def. 2.

65 That is, the six irrationals formed by addition. Cf. Book X, props. 71 and 72.

66 Cf. Book X, props. 19 and 21 respectively.

67 See the whole discussion from para. 4 to para. 8 of Part II, where the order and number of these irrationals are discussed (W., p. 30, foot, to p. 35).

68 That is, the six irrationals formed by addition.

69 a) That is, one of the six formed by subtraction.
b) If $x + y$ is an irrational formed by addition, then $x - y$ is an irrational formed by subtraction; granted $x > y$. G. J.

70 That is, the greater and the less of the two terms (or lines) that added together produce one of the six irrationals formed by addition, considered as a whole line and as a part of it as above. See Bemerkungen, page 24; for the various irrationals.

71 *Naẓīr* may mean *like, equal, corresponding to,* or *contrary.* In the next paragraph (W. p. 40, l. 19) the apotome and the binomial are said to be *contraries* of one-another *(—Wāḥiduhuma yukhālifu-l-ākhara —)*; in paragraph 16 (W. p. 44, ll. 13, 20, 21; p. 45, l. 1) the lines formed by addition and subtraction are said to be *contraries* respectively of one-another; and the like is asserted of them in paragraphs 19, 22, 23 (W. p. 47, l. 14; p. 48, l. 23; p. 53, ll. 11, 13), only here the word, *Muqā-*

balun (-opposite, contrary), replaces the *Yukhālifu* of paragraph 16. Contraries, moreover, may be homogeneous, belonging to the same genus at opposite poles of it (Cf. Aristotle's *Metaph.*, 1055a. 3ff., esp. 23ff.). The meaning of *Naẓīr*, therefore, would seem to be *contrary*. I have used, however, *like (or contrary)*, throughout, inasmuch as Binomials etc. and Apotomes etc. are *likes*, since they are produced by the same terms or lines, but *contraries*, since they are produced by addition and subtraction respectively (W. p. 39, l. 19).

[72] Cf. Part II, note 9.

[73] AB and BC are, therefore, rational and commensurable in square only.

[74] a) Cf. prop. 7, Book II of Euclid, which gives the positions of AB and BC as in the figure above, which is given by SUTER, but not in the MS. nor in WOEPCKE.

b) It is $AB^2 + BC^2 = 2AB \,.\, BC + AC^2$, since $AC^2 = (AB - BC)^2$. G. J.

[75] AB and BC being commensurable in square $(AB + BC$, a binomial).

[76] The clause, "Now the squares .... medial *(Fa-Murabba'u .... mawsiṭan)*, probably represents a Greek genitive absolute construction. Pappus shows by Euclid's prop. 7, Book II, that if $AB + BC$ is a binomial, then $AB - BC$ is an apotome. For $AB^2 + BC^2 = 2AB \cdot BC + AC^2$. Therefore $AC^2 = AB^2 + BC^2 - 2AB \cdot BC$. But $AB^2 + BC^2$ is rational and $2AB \cdot BC$ is medial; and AB^2 *is* $> BC^2$ by the square upon a straight line commensurable with AB. Therefore $\sqrt{AC^2}$ (i. e., $AC = AB - BC)$ is an apotome. See prop. 108 and compare it with prop. 71 (W. p. 40, ll. 9—11).

[77] Cf. note 71, Part. II.

[78] Note that $AB + BC$ is in this case a first bimedial. Cf. Book X, props. 109 and 71.

[79] See note 76, Part 11. If $AB + BC$ is a first bimedial, $AB - BC$ is a first apotome of a medial.

[80] Cf. the statement of the first of this series of propositions in para. 13, Part II (W., p. 40, ll. 8—9): — "Let AB produce with BC a binomial". The text is quite sound as it stands, and does not need to be emended to, "Let AB and BC be commensurable in square", as SUTER erroneously suggests (note 183).

[81] WOEPCKE's suggestion (p. 41, note 2) that this phrase be added to the text is sound, if not exactly necessary. In fact, since $AB + BC$ is given as a second bimedial, the previous phrase is also unnecessary. But both are perfectly sound consequences of the given fact, and if the first be given, so should the second.

[28] It does not seem necessary to insert the phrase, *Murabba'ai* ....

... *min*, as WOEPCKE does (p. 41, ll. 7—8, enclosed thus, (3) ... . (3)) The sense of the Arabic is quite plain without it. It says, "The sum of the squares etc. being greater than twice the rectangle, it is, then, the square upon the line AC". That is, it is greater by the square upon AC.

83 That is, the lines, AB and BC. G. J.

84 That is, if $AB + BC$ is a second bimedial, $AB — BC$ is a second apotome of a medial. Cf. Book X, props. 110 and 72.

85 That is, if $AB + BC$ is a major, $AB — BC$ is a minor. Cf. Book X, props. 108 and 71. AB^2 is, in this case, greater than BC^2 by the square upon a line incommensurable with AB.

86 AB and BC being incommensurable in square.

87 Cf. Book X, props. 109 and 71. If $AB + BC$ is the side of a square $= a$ rational + a medial area, $AB — BC$ is the line which produces with a rational area a medial whole.

88 Cf. Book X, props. 110 and 72. If $AB + BC$ is the side of a square = 2 medial areas, $AB — BC$ is the line which produces with a medial area a medial whole.

89 SUTER translates as if the Arabic word were a singular, probably for the sake of clarity.

90 I accept WOEPCKE's substitution of the marginal reading and translate accordingly, although the reading of the text could be considered satisfactory and rendered thus: — "That a rational area remains from a rational area (i. e., in this case). (W., p. 42, l. 13, note 4).

91 a) Two lines, since as the following sentence informs us, there are two cases of subtraction of a medial from a rational.

b) The reason must be sought in the relation of the medial, $\sqrt{b}$, to the rational, a. For $\sqrt{a - \sqrt{b}}$ produces the apotome, when $a^2 - b : a^2 =$ a square number : a square number. Otherwise the minor arises. See para. 24 (Part II) and Bemerkungen, page 25. G. J.

92 I have supplied the words within brackets for the sake of clarity.

93 The words within brackets, from "*The line*" to "*Arises*," have been suggested by WOEPCKE and incorporated in his text, except "*Area*," which is obviously to be supplied. The Arabic text is, as SUTER says (Note 186, p. 48), "stark verdorben". WOEPCKE's conjectures, however, are, from the mathematical point of view, necessary and, from the linguistic point of view, quite acceptable (W. p. 43, ll. 3—4, notes 3 & 4).

94 Cf. Part II, para. 9 (W. pp. 35—36) for this statement. In that paragraph Pappus asserts that Euclid should have treated the *compound lines* after this method; and here and in the next paragraph he points

out how clear then would be the homogeneity, with the opposition, of *compound lines* and *those formed by subtraction*. "*Two*" must be supplied after "*In each case*" *(Fi kulli wāhidin)* in the Arabic (W., p. 43, l. 6).

[95] Cf. the previous note and Book X, props. 36—41. These last two sentences connect para. 14 with para. 9 and also refer to the beginning of para. 14. itself.

[96] Cf. Book X, props. 36 and 73.

[97] Cf. Book X, props. 37 and 74.

[98] Cf. Book X, props. 38 and 75.

[99] Cf. Book X, props. 33, 39, and 76. The sum of the squares is rational and equal to the greater area, as is stated under "Sixthly" (prop. 35).

[100] Cf. Book X, props. 34, 40, and 77. The sum of the squares is medial and equal to the greater area.

[101] Cf. Book X, props. 35, 41, and 78. The sum of the squares is *medial* and equal to the greater area.

[102] Cf. Part II, para. 7.

[103] Cf. Book X, props. 71 and 108. The lines formed by addition are respectively the likes (or contraries) of those formed by subtraction, as Pappus says towards the end of the paragraph. As Suter says (note 190), Pappus means by, "Are taken", the kind of relation which the areas have with one-another, whether they are to be added together or subtracted from one-another. See Part II, note 71, for "*Contraries*".

[104] Cf. Book X, props. 36—38 and 39—41, 73—75 and 76—78. As Pappus says immediately after, the first three of each kind are respectively the contraries of the last three.

[105] Cf. Book X, props. 109, 108, and 71 (parts 1 and 3). In the one case the rational is the greater, the medial the less; in another the medial is the greater, the rational the less; and in the third case both the greater and the less are medials. Suter's notes 191 and 192 show that he did not understand the Arabic. Pappus now goes on to state what lines are the likes (or contraries) of one-another in these different respects.

[106] That is, the irrationals formed by addition and subtraction fall into groups of three according as the areas are, 1) rational and medial, 2) medial and rational, and 3) medial and medial. G. J.

[107] Suter points out (note 193) that the arithmetical mean by means of which the binomial is produced, is not mentioned. If this failure be due to the copyist, it means that he omitted a whole line, which probably began like the succeeding one with the Arabic words, *Wa-idha akhadha* (And if he took), whence his omission. Perhaps, however, Pappus himself overlooked this case or the translator failed to

reproduce it. Part I, para. 1 (W., p. 2, ll. 2—3) says that *Theaetetus* divided the irrational lines according to the different means. ascribing the medial line to geometry, the binomial to arithmetic, and the apotome to harmony.

108 Part I, para. 19 (beginning) (W., p. 19, l. 7ff.) explains what Pappus means by this clause. He says there: — "He (i. e., Euclid) always assigns the general term, medial, to a particular species (i. e., of the medial line). For the medial line the square upon which is equal to the area contained by two rational lines commensurable in length, is necessarily a mean proportional to these two rationals etc., but he does not name either of those [lines] medial, but only the line the square upon which is equal to the given area" (i. e., the one contained by two rationals commensurable in square only) (W. p. 45, ll. 7—8).

109 Cf. Book X, prop. 21.

110 The Arabic has simply, "The remaining proportioning" (Infinitive). The infinitive gives the abstract idea. The context shows that we must interpret as above (W. p. 45, ll. 13—14).

111 WOEPCKE (W. p. 45, l. 4, foot, note 3) substitutes *Wa-kāna* for the MS's *Li-anna*. The form of the argument demands *Fa-li-anna*. I have supplied, "*And so commensurable with them*", after the analogy of the argument given in the second succeeding case (W., p. 46, l. 2). The Arabic would run: — "*Wa-mushārikan la-humā*". See J. L. HEIBERG, *Euclidis Elementa*, Vol. V, p. 551, ll. 2—19.

112 The same phrase is used here and in the following enunciations as in the first instance. I adopt "*Arithmetical mean*" for the sake of brevity.

113 That is, common to all the arithmetical means taken above.

114 The text of the MS., given by WOEPCKE, is obviously corrupt. It says: — "Therefore these (i. e., the various means, or, perhaps, the required irrationals) are *incommensurable* with the irrationals of one order or another". The demonstrative pronoun, *Hadhihi* (W., p. 47, l. 7), which is feminine, must refer back either to the required irrationals or to the "*Them*" of "*All of them*" (i. e., the various means); and the latter is, logically, the more probable. The substitution of the text's "Incommensurable" *(Mubāyinatun)* for the logically required "Commensurable" *(Mushārikatun)* cannot easily be explained. Perhaps the thread of the argument was lost, the antecedent of *Hadhihi* not being clear. Possibly the error occurred in the Greek text.

[115] That is, if a and b are the extremes and c the mean, then $ac + bc = 2ab$, or $c = \frac{2ab}{a+b}$. — Cf. Bemerkungen p. 30.

[116] Cf. Part II, note 71.

[117] Cf Part II, paras. 21 and 22.

[118] The next case (W., p. 48, l. 6) shows that WOEPCKE's conjecture here (W., p. 47, l. 22, note 5) is incorrect. We must read: — "*Fa-in kāna khaṭṭā*, AB, BC, *manṭaqaini fi-l-quwwati mushtarikaini* etc."

[119] Cf. Part II, para. 17, beginning (W., p. 45, l. 3ff.).

[120] Here, then, is used the Euclidian proposition, X, 112. The further propositions which are presupposed, over the other five lines that are formed by addition and the corresponding ones formed by subtraction, are first proved in para. 21. G. J.

[121] That is, will meet DF within the points, D and F. Both WOEPCKE and the MS. have AF. But what succeeds shows that SUTER is correct in reading DF.

[122] Cf. the previous paragraph, first sentence.

[123] Cf. Book X, prop. 112, "The square upon a rational straight line applied etc."

[124] SUTER's note, 208, pointing out that Euclid does not prove these propositions, nor Pappus, but that they assume them to be self-evident, is false. Euclid, X, 112, proves the whole of this. G. J.

[125] That is, as in the previous paragraph with the same figure.

[126] SUTER quite correctly (note 210) supplies the words within brackets, which do not appear in WOEPCKE's text nor in the MS. See "Notes on the Text" (W. p. 51, l. 15).

[127] The figure is not given in the MS. or WOEPCKE. I follow SUTER.

[128] That is, in Part II, para. 22 (W., p. 51, l. 8ff.).

[129] At the beginning of this paragraph. Therefore CD is one of the lines formed by subtraction and of the same order as FB.

[130] Cf. Part II, note 71.

[131] A proposition is used here, which is correct, but which neither Euclid nor our commentator enunciates, namely, "If a line is commensurable in square with an irrational line formed by addition (or subtraction), then it is also an irrational line formed by addition (or subtraction) of the same order, G. J.

[132] Cf. Part II, paras. 19 and 20 (W., p. 47, l. 8ff.).

[133] We must either read, "*Al-Khuṭūṭi-llati min ismaini wa-l-munfaṣilati-l-muqābalati laha*", and translate as above, or, "*Al-Khuṭṭi-lladhi min ismaini wa-l-munfaṣili-l-muqābali lahu*", and translate, "Points of

difference between the binomial and the apotome, its contrary". The former gives a sense more in keeping with the contents of the paragraph than the latter. Read "*Yajī'u*", not "*Naḥnu*". The last letter is certainly a "*Ya*" (W. p. 55, ll. 3—4).

134 For this and the following sentences cf. Euclid, Book X, Definitions 11, 1—6 (See Heiberg, Vol. III, p. 136, Heath, Vol. III, pp. 101—102).

135 Cf. Part II, para. 12 (Beginning, W., p. 39, l. 9ff.). If $AB + BC$ $A \quad C \quad B$ is a binomial, then $AB - BC$, i. e., AC, is an apotome. "*Al-Munfaṣila*" (W., p. 55, l. 17) is an absolute nominative, which receives its syntactical relation when it is caught up and repeated in the phrase, "*Huwa munfaṣilun*" (W., p. 55, l. 19).

136 *Ma'na* means *definition*, as may be seen from Besthorn and Heiberg *Euclidis Elementa*, Al-Hajjāj, Vol. I, pp. 40—41. Cf. also the present text (W., p. 6, l. 7; p. 10, l. 21; p. 11, l. 1; p. 27, l. 17). *Al-Akwān* according to M. Horten, Z. D. M. G., 1911, Vol. 65, p. 539, means *die Formen des veränderlichen Seins*, or *Seinsformen* (W. p. 56, l. 7). It might be rendered, however, by *the form of their being or existence*, i. e., in time and space.

137 For this proposition as also for paragraphs 27—32 (Part II) see Bemerkungen, p. 31.

138 Since LM is rational and $MP = AB^2$. (Cf. Euclid, Book X, prop. 60. G. J.)

139 Since LM is rational and $MP = AB^2$. (Cf. Euclid, Book X, prop. 63. G. J.)

140 That is, the squares upon a binomal ~~and~~ a major. Cf. Part II, para. 25.

141 Cf. Euclid, Book X, prop. 71.

142 The names of the two rectangles have been interchanged. EG should be the one mentioned first. Cf. the next paragraph, 28 (W., p. 60, l. 15).

143 In the previous paragraph. Cf. Euclid, Book X, prop. 25. CF is medial and commensurable with CD in square.

144 One would expect this sentence to begin, "*Wa-dhalika innahu li-anna*", as the corresponding sentence of the next part of the proof (14 lines later, W., p. 59, l. 19) has, "*Wa-dhalika innahu lamma*". "*Wa-dhalika innahu*" should, therefore, I think, be inserted in the text (W. p. 59, l. 7).

145 Cf. Euclid, Book X, prop. 37.

146 It is to be shown that CG is a first or a second bimedial, i. e., is of the form, $\sqrt[4]{b}\,(a + \sqrt{b})$ or $\sqrt[4]{c}\,(a + \sqrt{b})$. In the first case the rectangle contained by the two parts (terms) is rational, namely,

$\sqrt[4]{b} . a . \sqrt[4]{b} . \sqrt{b} = ab$; in the second case it is medial, namely, $\sqrt[4]{c} . a . \sqrt[4]{c} . \sqrt{b} = a . \sqrt{bc}$. — This rectangle is geometrically = $CF \cdot FG$. The rectangle $CF \cdot CD$ is in any case rational. The two cases can also, therefore, be distinguished from one-another, according as FG is commensurable with CD in length or not, or, — and the commentator always begins with this —, according as the rectangle EG is commensurable with CD^2 or not. G. J.

147 Suter translates correctly, but has failed to remark that his translation does not give the Arabic text as it stands. This last clause in the Arabic is conjunctive with the two previous and not the apodosis of a conditional sentence. We must read, therefore, "*Fa-Khaṭṭu* . . ." and not, "*Wa-Khaṭṭu* . . .", as in Woepcke and the MS. (W., p. 60, l. 20).

148 Cf. the previous paragraph on this point at note 145. Suter does not give the correct connection of the Arabic clauses.

149 To make sense of this clause and to make it correspond with paras. 27—32, the Arabic must mean that neither of the two terms of these binomials is commensurable with the line LM. G. J.

150 Dr. Junge points out that we must translate thus in order to give a meaning to this clause. The Arabic reads, "*Wa-li-anna*", which would ordinarily be translated, "*But since* etc."; the beginning of a new statement altogether. But the clause obviously qualifies the previous one, as Woepcke felt, when he suggested that we read "*Li-anna*", instead of "*Wa-li-anna*". This suggestion, however, does not remove the difficulty. It is probable that the Greek at this point had some particle such as ὅτε or ἐπειδή —, which the Arab translator understood in its causal instead of its temporal sense, thereby introducing confusion into the text (W. p. 61, l. 15).

151 Namely, the one commensurable with CD^2.

152 Cf. Book X, prop. 25. CG, therefore, is either a first or a second bimedial (Cf. props. 37 and 38), and Pappus has demonstrated his proposition, Suter notwithstanding (See his note 232).

153 That is, of those formed by addition.

154 Suter deems it necessary to give the construction of these rectangles, but the sense is quite clear, as the text stands.

155 The reading of the MS. ("But because the rectangle is rational etc.") is obviously incorrect. It assumes what is to be proved, namely, the rationality of the rectangle MO. We must read simply "*But*" ("*Wa-lakin*", or better, perhaps, just "*Wa*") and omit the "*Because*" ("*Li-anna*"). Suter did not understand the argument, as his translation of the next clause shows.

sition 115; and in the MS. there stands before "*Bi-Ḥasabi*", "*Lahu*", scored out apparently by two almost perpendicular strokes, but with an asterisk above it calling attention to some fact or other. The asterisk does not refer to the elimination of the two words, *La* and *Hu*. This is not the practice of the copyist. It calls attention to the fact that the *Hu* is scored out by the left-hand stroke, and that the right-hand stroke is an *Alif*, making with the *Lam* the negative *La*. Read, therefore, "*La bi-Ḥasabi*" (W., p. 67, l. 6).

174 a) Suter rightly calls attention to the fact that the text given by Woepcke has a meaning that is not to be taken in a strict mathematical sense, namely, "Infinite times an infinite number", since the correct mathematical number is $12 . x = \infty$ (Not $13 . x$, as Suter has it; only the lines formed by addition and subtraction are referred to in this clause). But the MS. gives, as Woepcke shows (P. 67, note 4), "*Ghairu Mutanāhiyatin mirāran mutanāhiyatin*", which may be rendered as above and satisfy the mathematical requirements.

b) For Euclid the irrational lines were already infinite in number. The binomials, for example, were $1 + \sqrt{2}$, $1 + \sqrt{3}$, $1 + \sqrt{5}$, $1 + \sqrt{6}$ ..... ad infinitum. On the other hand the groups of irrationals were, for Euclid, 13. Our commentator, however, treats of the number of the groups. The trinomial $(1 + \sqrt{2} + \sqrt{3})$, the quadrinomial $(1 + \sqrt{2} + \sqrt{3} + \sqrt{5})$, are ever new groups, the number of which is infinite. G. J.

175 Suter translates "The geometric mean", but the Arabic, strictly speaking, has only "The mean proportional" without specifying which (W. p. 67, l. 12).

176 Or, "Is definite (W. p. 67, l. 19).

APPENDIX A.

Paragraphs 10 and 11 of Part I discuss the definition of lines commensurable in length and square found in Plato's *Theaetetus* (147 d.—148 a.) in respect of that of Euclid (Book X, prop. 9). Unfortunately the Theaetetus passage affords little help for the interpretation of these two paragraphs, since commentators of the Theaetetus seem to be hopelessly at odds over the interpretation of this passage and, in especial, concerning the meaning of the two key-words, δύναμις and τετραγωνίζειν.

Some commentators (e. g., M. WOHLRAB (1809), B. GERTH, and OTTO APELT (1921)) hold that δύναμις in 147 d. means *square;* and this is the only sense in which it is used as a mathematical term by Pappus Alexandrinus (Cf. FR. HULTSCH, Vol. III, Index Graecitatis, p. 30.) and by Euclid. Others (e. g., L. FR. HEINDORF (1809), SCHLEIERMACHER, JOWETT, CAMPBELL (1883), PALEY (1875), and A. DIES (1924) contend that it must be taken in the sense of *square root*, or, in geometrical terms, *side of a square*. Some commentators derive the meaning, *square root*, or *side of a square*, for the δύναμις of Theaetetus 147 d. from a comparison of its use in 148 a. as a general term for all lines that are incommensurable in length but commensurable in square, but find, then, a difficulty in explaining what exactly 147 d.ff. means. CAMPBELL *(The Theaetetus of Plato*, 2nd Ed., Oxford, 1883, p. 21, note 1.) supposes that δύναμις in 147 d. is an abbreviation for ἡ δυναμένη γραμμὴ εὐθεῖα and bases this assumption on Euclid's use of δυναμένη in Book X, Definitions 3—11 etc. The fact remains, however, that Euclid uses δύναμις in Book X in the sense of *square* only.

Another argument in support of the meaning, *square root*, or *side of a square*, goes back to HEINDORF (1805), who says (*Platonis Dialogi Selecti*, Vol. II, p. 300, § 14, Berlin 1805): — "Scilicet δύναμις τρίπους est εὐθεῖα δυνάμει τρίπους (velut Politic. p. 266. b. dicitur ἡ διάμετρος ἡ δυνάμει δίπους), seu latus quadrati trepedalis". This suggestion is adopted by B. H. KENNEDY (Cambridge University Press 1881) who omits, however, HEINDORF's "scilicet" and says: — "τρίπους, as HEINDORF says, is εὐθεῖα δυνάμει τρίπους"; and naturally δύναμις is *square root* or *side of a square*. But the analogy of HEINDORF's phrases is extremely doubtful, and the contraction finds no support in later mathematical usage.

STALLBAUM (*Platonia Opera Omnia*, Vol. VIII, sect. I, 1839.) and PALEY (*The Theaetetus of Plato*, London, 1875.) also adopt HEINDORF's interpretation of δύναμις τρίπους. They contend, however, that Plato in 147d. is considering rectangles composed of a three-foot and a five-foot line. The relation, then, of 147d. to the discussion in 148a. is somewhat obscure, to say the least.

The Arabic word for δύναμις is "*Quwwatun*", and it means as a mathematical term *square* and *square* only. *The Dictionary of Technical Terms* (Calcutta, A. SPRENGER, Vol. II, p. 1230, top.) defines it as "*Murabba'u-l-Khaṭṭi*", i. e., "the square of the line", "the square which can be constructed upon the line", and goes on to say that the mathematicians treat the square of a line as a *power* of the line, as if it were potential in that line as a special attribute. Al-Ṭūsī (Book X, Introd., p. 225, l. 9.) says: — "The line is a length actually (reading "*bi-l-fi'li* "for" *bi-l-'aqli*) and a square (*murabba'un*) potentially (*bi-l-quwwati*) i. e., it is possible for a square to be described upon it. Lines commensurable in *power* ("*bi-l-quwwati*") are those whose squares ("*murabba'ātu-hā*") can be measured by the same area etc"; and in Book X he uses "*Quwwatun*" in the sense of *square* only and only in the phrases, *lines commensurable (etc.) in* *square* and *the square on a straight line etc*; and in the latter phrase the word, "*Murabbaʿun*" (square) is sometimes used instead of "*Quwwatun*".

An analysis of our two paragraphs (10 & 11) shows that "*Quwwatun*" (power) is used in two senses. It is used in paragraph 11 once (p. 11, l. 15) in the same sense as δύναμις in Theaetetus 148a., i. e. as *the side of a square which is commensurable in square but not in length.* In all other cases it means *square* and *square* only. Its use in the first sense is quite exceptional and is explained by its occurring in a direct citation of the Theaetetus passage where δύναμις is used in this sense; and Pappus explains in paragraph 17 (p. 17, ll. 16—17) that the word δύναμις *("Quwwatun")* was used in this case, "because it (the line) is commensurable with the rational line in the area which is its square (literally, which it can produce)". The origin of this sense is, therefore, quite clear.

In paragraph 10 (p. 10, ll. 7, 8, 18) the phrase, *commensurable in square*, occurs. In paragraph 11 (p. 11, l. 22—p. 12, l. 2) we find the significant statement that "It is difficult for those who seek to determine a recognized measure for the lines which have the power to form these *powers*, i. e., the lines upon which these *powers* can be formed —, to follow the investigation of this problem (i. e. of irrationals)", where the word, *powers*, must mean *squares*. Paragraph 11 (p. 11, ll. 17—18) is quite as significant, pointing out that "The argument of Euclid, on the other hand, covers every *power* and is not relative only to some assumed rational *power* or *line*," where the words, "*or line*," show that *power* is to be taken in the sense of square. Finally in paragraph 10 (p. 10, l. 17—p. 11, l. 8) *Quwwatun* (power) can signify *square* and *square* only. For in the first place, in Euclid's definition of lines commensurable in length and square as those whose *powers (qiwāhum)* have to one-another the ratio of a square number to a square number (p. 10, ll. 17—18), *powers* must mean *squares* (cf. Bk. X, prop. 9). It follows also that *powers* must mean *squares* when three lines later it is stated (p. 10, l. 21—p. 11, l. 2) that the idea (found in the Theaetetus) of determining those *powers* by means of the square numbers is a different idea altogether from that (in Euclid) of their having to one-another the ratio of a square number to a square number"; or what other basis for the comparison of the two definitions is there? The two *powers* of p. 11, ll. 2ff. are also squares; for they have to one-another the ratio of a square number to a square number, as in Euclid's definition, and their sides also are commensurable according to the same authority.

The fact that the two *powers* of p. 11, ll. 2—8, are squares, eliminates two difficulties that arise, namely, the meaning of the Arabic word, *Rabba'a*, and of the phrase, "The *power* whose measure is a foot or three feet or five feet etc." For it is evident that the phrase, "A *power* whose measure is eighteen (or eight) feet", must mean, "A *power* (square) whose measure is eighteen (or eight) square feet", since power here means square (p. 11, ll. 2—3)[1]. Accordingly the phrase, "A *power* whose measure is one foot", can and does mean, "A *power* (square) whose measure is one square foot"; and the same argument is valid in the case of the two phrases, "The *power* whose measure is three feet", and "The *power* whose measure is five feet" (p. 10, ll. 10—11; p. 11, ll. 11, 13, 16, 20; p. 11, l. 12).

The verb, *rabba'a*, occurs in two phrases, "The *powers* which *square* a number whose sides are equal", and "Those which *square* an oblong number" (p. 10, ll. 14, 15; p. 11, ll. 14, 15). The Greek word behind *rabba'a* here is evidently the τετραγωνίζω of Theaetetus 148a. But neither *rabba'a* nor τετραγωνίζω means, as CAMPBELL supposes in the latter case, *To form as their square*, i. e., *The square on which is*, but *To form into a square figure*, *Ad quadratam formam redigere*, as WOHLRAB puts it; and this is the only sense in which Pappus Alexandrinus uses the verb τετραγωνίζω (Cf. FR. HULTSCH, III, Index Graecitatis, p. 111); and he employs its participle τετράγωνον and τετράγων in the same way with reference to the problem of *squaring* the circle.

Accordingly the phrase, "The *powers* which *square* a number etc", means "The *powers* (squares) which form such a number into a square figure"[2]. WOHLRAB and APELT have interpretated the Theaetetus passage (148 a.) in this way, the former translating it, "Alle Linien welche die gleichseitige Produktzahl als Quadrat darstellen", and the latter, "Alle Linien nun, die die Seiten eines nach Seiten und Fläche kommensurabeln Quadrates bilden".

To sum up. The Arabic word, *Quwwatun*, means as a mathematical term *square* and *square* only. In our two paragraphs it signifies *square* save in one instance, where it is used to render the δύναμις of Theaetetus 148 a., which use of it is clearly exceptional. Such phrases, therefore, as "The *power* whose measure is a foot", must be interpretated as "The *power* (square) whose measure is a square foot", and the verb, *rabba'a*, must be rendered, *To form into a square figure*. Pappus, therefore, on this evidence, took the δύναμις of Theaetetus 147 d. in the sense of *square*, and the τετραγωνίζω of 148 a. in the sense of *to form into a square figure*[2]. That is, the phrase. "All the lines which *square* a number whose sides are equal", in 148 a., meant for Pappus, "All the lines which are the sides of a square *squaring* such a number", as in the problem of *squaring* the circle: and what Theaetetus did, then, was to distinguish between squares commensurable in length and square, and squares commensurable in square only.

NOTES.

[1] Cf. p. 15, ll. 21—22, where similar phrases evidently denote the square measures.

[2] That is, 4, which is a square number, has for its *sides* (factors), $\sqrt{4} = 2$. But 6, which is an oblong number, has for its *sides*, 3 and 2; and the side of the square formed from it would be $\sqrt{6}$, which is inexpressible, i. e., in whole numbers.

INDEX.

N. B. The numbers after those giving the Part of the Treatise refer to the paragraphs.

A.

Actuality. Part I, 13.

Addition (as a means of irrationality). Part I, 9.

Annex. Part I, 23, 32.

Apollonius. Part I, 1; Part II, 1.

Apotome. Part I, 1, 7, 21, 23, 32, 33, 34; Part II, 3, 12, 13, 14, 15, 17, 19, 20, 22, 24, 25, 26, 30.

First apotome of a medial. Part I, 32; Part II, 12, 13, 14, 15, 19, 20, 22, 25, 26, 30, 31, 32.

Second apotome of a medial. Part I, 23, 32; Part II, 12, 13, 14, 15, 19, 20, 22, 26, 30, 31, 32.

Athenian Stranger. Part I, 2, 12.

B.

The first bimedial. Part I, 22, 29, 32; Part II, 7, 9, 12, 13, 15, 17, 18, 19, 20, 22, 26, 27, 28, 29.

The second bimedial. Part II, 7, 9, 12, 13, 15, 17, 18, 19, 20, 22, 25, 26, 27, 28, 29.

The binomial. Part I, 1, 21, 22, 27, 28, 29, 32; Part II, 7, 10, 12, 13, 15, 17, 18, 19, 20, 22, 24, 25, 26, 27.

Bulk. Part I, 13.

C.

Commensurability. Part I, 1, 4, 6, 12, 15, 21, 24; Part II, 34.

Commensurable (lines, i. e., in length or square or in both). Part I, 7, 10, 12, 13, 15, 16, 17; Part II, 6, 11 (See Quantities).

Commensurables among Irrationals. Part I, 6.

Compound lines (those formed by addition). Part I, 22; Part II, 13.

Continuous things. Part I, 4.

Contraries. Part I, 3.

D.

The three dimensions. Part I, 12.

E.

The Equal (of Parmenides). Part I, 13.
Euclid. Part I, 1, 3, 6, 7, 10, 11, 16, 19; Part II, 1,16, 22, 25, 27.
Euclid's Elements. Part I, 1, 3, 4, 11, 12, 16 etc.
Eudemus the Peripatetic. Part I, 1.
Extension. Part I, 13; Part II, 18, 19.

F.

Figure. Part I, 13.
The Finite. Part I, 3, 6, 8.
The First Cause. Part I, 13.
Form. Part I, 13.

G.

The Greater (of Parmenides). Part I, 13.

I.

Incommensurability. Part I, 1, 4, 9, 13, 14, 21, 24, 35, 36.
Incommensurable (of lines and magnitudes). Part I, 3, 7, 12, 13; Part II, 11.
Inconceivable (= Irrational). Part I, 2.
The Infinite. Part I, 3.
Irrationality. Part I, 9, 13.
Irrationals. Part I, 1, 2, 3, 4, 5, 7, 11, 12, 14, 15, 18; Part II, 4, 34.
Ordered irrationals. Part I, 1; Part II, 1, 2.
Unordered irrationals. Part I, 1; Part II, 1, 2.
Irrationals formed by addition. Part I, 4, 21, 23, 26, 27, 29, 30, 31, 36; Part II, 2, 3, 12, 13, 14, 16, 17, 19, 25, 26, 32, 33, 33.
Irrationals formed by subtraction. Part I, 4, 21, 23, 32, 33, 34, 35, 36; Part II, 2, 6, 12, 13, 14, 16, 17, 19, 25, 26, 32, 33.
Irrational magnitudes. Part I, 5.

L.

Length (= Rational). Part I, 11.
The Less (of Parmenides). Part I, 13.
Limit. Part I, 13.
Line. Part I, 13.
Compound lines (those formed by addition). Part II, 3.
The line the square upon which is equal to a rational plus a medial area. Part I, 22, 32; Part II, 4, 8, 12, 15, 17, 18, 19, 20, 22, 25, 28.
The line the square upon which is equal to two medial areas. Part I, 22, 32; Part II, 4, 8, 12, 15, 17, 18, 19, 20, 22, 25, 29.

The line which produces with a rational area a medial whole. Part I, 23, 32; Part. II, 12, 13, 14, 15, 19, 20, 22, 31.
The line which produces with a medial area a medial whole. Part I, 23, 32; Part II, 12, 13, 14, 15, 19, 20, 22, 32.

M.

Magnitudes. Part I. 5, 13, 14.
The major. Part I, 22, 32; Part II, 4, 8, 12, 13, 15, 17, 18, 19, 20, 22, 25, 27.
Matter. Part I, 13.
Matter intelligible and sensible. Part I, 13.
Maximum. Part I, 3, 5.
Means. Part I, 1, 9, 18, 19.
Arithmetical mean. Part I, 1. 9, 17; Part II, 17, 18, 20.
Geometric mean. Part I, 1, 9; Part II, 17, 20.
Harmonic mean. Part I, 1, 9; Part II, 17, 19, 20.
Measure (unit of measurement). Part I, 5, 13, 14.
The medial. Part I, 1, 4, 6, 7, 9, 14, 15, 19, 20, 21, 25, 36; Part II, 4, 5, 6, 17, 20, 26, 33.
Medial area. Part I, 4, 19, 28; Part II, 4.
Minimum. Part I, 3, 5, 6.
The minor. Part I, 23, 32; Part II, 12, 13, 14, 15, 19, 20, 22, 30.

N.

Numbers. Part I, 3, 5, 8, 10, 11, 13.

O.

One. Part I, 3.

P.

Parts. Part I, 3, 13.
Plane. Part I, 13.
Plato. Part I, 1, 3, 10, 11, 12, 13, 17.
Plato's De Legibus. Part I, 12.
Plato's Parmenides. Part I, 13.
Plato's Theaetetus. Part I, 1, 10, 11, 12, 17, 20.
Plurality. Part I, 3, 8.
Potential. Part I, 13.
Power (= square). Part I, 1, 10, 11.
Power (= surd). Part I, 11 (once).
Proportion. Part I, 6, 9, 24; Part II, 17, 19.

Geometric proportion. Part I, 19; Part II, 17, 19.
Mean proportional. Part I, 19, 20, 22, 23; Part II, 35.
Pythagoreans. Part I, 1, 2.

Q.

Quadrinomial. Part I, 21, 22.
Continuous quantities, commensurable and incommensurable, rational and irrational, finite. Part I, 1, 3, 4, 5, 6, 8, 9, 13, 14, 24; Part II, 6.

R.

Ratio. Part I, 5, 6, 8, 9.
Rationality. Part I, 15.
Rationals. Part I, 1, 4, 5, 6, 7, 14, 23.
Rational area. Part I, 4, 19, 20.
Rational Lines. Part I, 4, 7, 14, 15, 16, 17, 18, 20, 25; Part II, 4,
Rational quantities. Part I, 1, 14.

S.

Substance of the Soul. Part I, 9.
Subtraction (and Irrationality). Part I, 9.
Surd. Part I, 11 (once).

T.

Theaetetus. See Plato.
Theodorus. Part I, 10, 11.
Total. Part I, 3.
Triad. Part I, 9.
First and second trimedial. Part I, 22.
Trinomial. Part I, 21, 22.

U.

Unity. Part I, 3.

W.

Whole. Part I, 3, 13.

بسم الله الرحمن الرحيم

المقالة الاولى

من كتاب ببس فى الاعظام المنطقة والصمّ

التى ذكرها فى

المقالة العاشرة من

كتاب اوقليدس

فى الاسطقسات

ترجمة ابى عثمن الدمشقي[1]

---

§ 1 ان القصد فى المقالة العاشرة من كتاب اوقليدس فى الاصول[2] هو البحث عن الاعظام المشتركة والمتباينة والمنطقة والصمّ وذلك ان هذا العلم ابتدأ به اولا شيعة بوثاغورس وزاد فيه زيادة كثيرة ثااطيطس الاثينى الذى كان على حال من القطنة فى هذه الاشياء وغيرها من اصناف التعاليم يستحق بها التعجب منه وكان مع ذلك من اجود الناس جبلة[3] وتأتّى لاستخراج[3] الحق الذى فى هذه العلوم كما يشهد له بذلك فلاطن فى الكتاب[4] الذى سماه باسمه فاما تمييزها اليقينى وبراهينها التى لا يلحقها طعن فاظن ان هذا الرجل خاصة احكمها وبعده ابلونيوس الجليل الذى هو فى غاية

Pag. 2 ما يكون فى القوة فى التعاليم حرص وعنى الى ان | زاد فيها اصنافا[5] عجيبة
لان ثاطيطس ميّز القوى المشتركة فى الطول من المتباينة وقسّم المشهورة
جدًا من الخطوط الصمّ على الوسائط فجعل الخط الموسط للهندسة وذا
الاسمين للعدد والمنفصل للتاليف كما اخبر[6] اوذيمس[7] المشّاء فاما اقليدس
فانه قصد قصد قوانين لا يلحقها طعن فوضعها لكل اشتراك وتباين ووضع
حدودا وفصولا للمنطقة والصم ووضع ايضا مراتبا كثيرة للصم ثم آخر
ذلك اوضح[8] جميع التناهى الذى فيها واما ابلونيوس ففصّل انواع الصم
المنتظمة واستخرج علم التى تسمى غير منتظمة وولد منها جملة كثيرة
جدًّا بالطرق اليقينية

§ 2 فاذ كان هذا هو الغرض والقصد فى هذه المقالة فتثبيتنا للمنفعة فيها
ليس هو من الفضل فان شيعة بوثاغورس بلغ من اجلالهم[9] لهذه الاشياء
ان كان غلب عليهم[10] قول من الاقاويل وهو ان اوّل من اخرج علم الصم
وغير المنطقة واذاعه فى الجمهور لقد غرق وخليق انهم كانوا يعنون بذلك
على طريق اللغز ان كل ما كان فى الكل من اصم وغير منطق وغير مصوّر
فالستر به أَوْلى وان كل نفس تظهر وتكشف بالحيرة[11] والغفل ما كان فيها
او فى هذا العالم مما هذه حاله[12] فانها تجول فى بحر عدم التشابه غرقة فى
مرور الكون[13] التى لا نظام لها فهذه ما[14] كانت تراه شيعة بوثاغورس
والغريب الاثينى يسوق الى الحرص والعناية بهذه الامور ويوجب غاية[15]
الجهل على من يتوهم انها شىء خسيس

§ 3 فاذا الامر على هذا فمن اثر منّا ان ينفى عن نفسه مثل هذا العار
فليعلم هذه الامور من فلاطن مميّز الاحداث[16] المستحقة للعار[17] وليفهم

Pag. 3 هذه | الاقاويل التى قصدنا قصدها[18] وليتامل الاستصفاء العجيب الذى استقصاه اقليدس فى واحد واحد من معانى هذه المقالة لان هذه الاشياء التى قصدنا[18] فى هذا الموضع لتعليمها هى خاصّة المقومة لذات الهندسة وذلك ان[19] المتباين[20] والاصمّ اما فى الاعداد فغير موجودة بل الاعداد كلها منطقة ومشتركة فاما فى الاعظام التى انما النظر فيها للهندسة فقد تتخيّل[21] والعلة فى ذلك ان الاعداد تتدرج وتتزيد من شىء هو اقل قليل وتمرّ الى غير نهاية فاما الاعظام فبعكس ذلك اعنى انها تبتدى من الجملة المتناهية وتمرّ فى القسمة الى غير نهاية فاذا[22] كان الشىء الذى هو اقل قليل غير موجود فى الاعظام فمن البيّن انه ليس يوجد قدر ما مشترك لجميعها كما يوجد الوحدة للاعداد لكنه واجب ضرورة ألّا يوجد فيها الشىء الذى هو اقل قليل واذا لم يوجد فغير ممكن ان يدخل الاشتراك فى جميعها فان طلب احد من الناس العلة التى لها يوجد اقل القليل فى الكمية المنفصله ولا يوجد فيها اكثر الكثير وفى الكمية المتّصلة يوجد اكثر الكثير ولا يوجد اقل القليل فينبغى ان تقول له ان امثال هذه الاشياء انما تميزت بحسب مجانستها للنهاية وما لا نهاية وذلك ان فى كل واحد من تقابل الموجودات اشياء هى ذوات نهاية واشياء متولدة عما لا نهاية مثل تقابل الشبيه وغير الشبيه والمساوى[23] وغير المساوى[24] [والوقوف] والحركة [فانّ الشبيه والمساوي] والوقوف يؤ[دّون] الى التناهى واما غير الشبيه وغير المساوى[24] والحركة فمؤدية الى ما لا نهاية وكذلك الحال فى سائر الاشياء الاخر وعلى هذا المثال يجرى الامر فى الوحدة والكثرة والجملة والاجزاء فالواحد والجُملة بين انهما من حيّز التناهى والاجزاء

والتقسيم فانه قد استقصى الكلام فى هذه كلها ووفاه حَقَّهُ على التمام ثم انه يُعَقِّب الاقاويل المشتركة فى الاعظام المشتركة والمتباينة بنظر فى امر المنطقات والصم ويبين ما منها منطقة[35] فى الامرين جميعا اعنى فى الطول والقوة وهى التى لا يتخيّل[36] فيها شىء من الصمم وما[37] منها منطقة فى القوة وهى المحدثة لاول الخطوط الصم الذى[38] يسميه الموسط وذلك ان هذا الخط اكثر الخطوط مجانسة للخطوط المنطقة ولذلك صارت الخطوط الموسطة منها ما هى موسطة فى الطول[39] والقوة على مثال[40] ما يوجد عليه المنطقة ومنها موسطة[41] فى القوة فقط والشىء الذى يتبين به خاصة مجانستها لها هو هذا ان المنطقة فى القوة تحيط بسطح موسط والموسطة فى القوة ربما تحيط بمنطق وربما تحيط بموسط وتولد[42] من هذه خطوطا اخر[43] صما كثيرة الاصناف فمنها ما تولده بالتركيب ومنها ما تولده بالتقسيم ويتبين اختلافها من مواضع كثيرة وخاصة من السطوح التى تقوى عليها ومن اضافة هذه السطوح الى الخط المنطق وبالجملة لما افادنا العلم باشتراكها واختلافها انتهى الى اظهار عدم تناهى الصم وتمييزها وذلك انه يبين انه من خط واحد اصم وهو الموسط تحدث صم بلا نهاية مختلفة فى النوع وجعل انقضاء المقالة من هذا الموضع وترك النظر فى الصم لخروجها الى ما لا نهاية فهذا مقدار ما كان يجب ان تقدم من القول فى غرض هذا الكتاب ومنفعته وقسمة جمله

Pag. 6 § 5 | وينبغى ايضا ان نبحث من الراس لنعلم الى اى شىء ذهبوا عند ما ميّزوا المقادير فقالوا ان بعضها مشترك وبعضها متباين اذ كان لا يوجد فى الاعظام قدر هو اقل القليل لكن الامر فيها على حسب ما بين فى الشكل

الاول أنه قد يمكن ان يوجد لكل قدر مفروض[44] اصغر من قدر[44] قدر اخر اصغر[45] منه وبالجملة كيف يمكن ان يوجد اصناف المقادير الصم اذ كانت الاعظام المتناهية كلها لبعضها عند بعض نسبة وذلك انه قد يمكن اذا ضوعفت ان يفضل بعضها على بعض لا محالة وهذا هو معنى ان يكون لشيء نسبة عند شيء كما تعلمنا فى المقالة الخامسة فنقول انه متى ذهب احد الى هذا المذهب لم يسلم له انه يوجد قدر اصم او غير منطق ولكن ينبغى ان نعلم من هذا الامر ما هذا بِمَبْلَغِهِ[46] وهو ان القدر اما فى الاعداد فموجود بالطبع واما فى الاعظام فليس هو[47] موجود بالطبع بسبب القسمة التى تقدّمنا[48] وقلنا مرارا انها تمر بلا نهاية لكنه قد[49] يوجد فيها بالوضع وبتحصيل التوهّم[50] وذلك انا نفرض قدرا ما محدودا ونسميه[51] ذراعا او شبرا او شيئا[52] اخر شبيها بذلك ثم ننظر الى ذلك العدد[53] المحدود المعلوم عندنا فما امكنّا ان نقدره به من الاعظام سميناه منطقا وما لم يقدره هذا القدر جعلناه فى مرتبة الاعظام الصم فيكون المنطق على هذا الوجه ليس هو شيئا اخذناه عن الطبيعة لكنه مستخرج من خيلة الفكر الذى حصل القدر المفروض فلذلك وجب ان لا يكون الاعظام كلها منطقة بحسب قدر واحد مشترك لان القدر المفروض ليس هو قدرا لها كلها ولا هو فعل من افعال الطبيعة لكنه من افعال الفكر ولا الاعظام ايضا[53a] كلها صم لانّا قد ننسب مساحة اقدار ما الى حد معلوم عندنا منتظم

Pag. 7 § 6 | وانما ينبغى[54] ان نقول ان التناسب نفسه[55] فى الاعظام المطلقة اعنى المتناهية[55] المتجانسة يكون[56] على وجه ويقال فى الاعظام المشتركة على وجه اخر وفى الاعظام التى تسمى المنطقة على وجه اخر وذلك ان

النسبة فيها فى بعض المواضع انما[57] تعلم على هذا المعنى فقط وهو انها اضافة اعظام متناهية بعضها الى بعض فى باب العظم والصغير وفى بعض المواضع على انها موجودة باضافة من الاضافات الحاصلة[58] فى الاعداد ولذلك تبين ان الاعظام المشتركة كلها نسبة بعضها الى بعض كنسبة عدد الى عدد وفى بعض المواضع اذا جعلنا النسبة بحسب القدر المفروض المحدود وقفنا على الفرق بين المنطقة والصم[59] لان الاشتراك ايضا قد يوجد فى الصم[59] وقد علمنا ذلك من اوقليدس نفسه اذ يقول ان بعض الموسطات مشتركة فى الطول وبعضها مشتركة فى القوة فقط والامر بين ايضا ان المشتركة من الصم نسبة بعضها الى بعض كنسبة عدد الى عدد الا انه ليس على ان النسبة تكون[60] بحسب ذلك القدر[61] المفروض وذلك انه ليس يمنع مانع من ان يكون فى الموسطة نسبة الضعفين والثلثة الاضعاف ومقدار الثلث والنصف ليس يعلم كم هو وهذا المعنى ليس يعرض فى المنطقة اصلا لانا نعلم[62] لا محالة ان الاقل فى تيك معروف[63] اما ان يكون مقدار ذراع او ذراعين او محصل بحد ما اخر حاله هذه الحال فاذ الامر على هذا فالمتناهية كلها حالها فى النسبة بعضها الى بعض على وجه ما وحال المشتركة على وجه اخر وحال المنطقة كلها على وجه اخر غير ذينك الوجهين وذلك ان نسبة المنطقة هى نسبة المشتركة ايضا وهى نسبة المتناهية ونسبة المتناهية ليس هى لا محالة نسبة المشتركة لان هذه | النسبة ليست من الاضطرار كنسبة عدد Pag. 8
الى عدد ونسبة المشتركة ليس هى ضرورة نسبة المنطقة وذلك ان كل منطق مشترك وليس كل مشترك منطقا

§ 7 ولذلك متى فرض خطان مشتركان وجب ضرورة ان نقول انهما اما

منطقان جميعا واما اصمان ولا نقول ان احدهما منطق والاخر اصم لان المنطق لا يكون[64] فى حال من الاحوال مشاركا للاصم فاما اذا اخذ خطان مستقيمان غير مشتركين فَلَنْ يَخْلُوَا ضرورة من احد امرين اما ان يكون احدهما اصم[65] والاخر منطقا واما ان يكون كلاهما اصمين وذلك ان الخطوط المنطقة انما يوجد فيها الاشتراك فقط فاما الصم فقد يوجد فيها الاشتراك من جهة والتباين من اخرى فان المختلفة فى النوع من الصم متباينة لا محالة وذلك انها اذا كانت مشتركة فهى لا محالة[66] متّفقة فى النوع اذا كان الخط المشارك للموسط موسطا والمشارك للمنفصل منفصلا وكذلك الامر فى الخطوط الاخر كما يقول المهندس

§ 8 فليس كل نسبة اذًا توجد فى العدد وليس كل ما له نسبة فنسبته كعدد الى عدد لان ذلك لو كان لكانت كلها مشاركة بعضها لبعض وخليق ان يكون لما[67] كل عدد مجانس للنهاية فان العدد ليس هو كثرة كيف ما اتفقت لكنه الكثرة المتناهية[68] وكانت النهاية[69] مجاوزة لطبيعة[69] العدد صارت النسبة التى من النهاية توجد فى الاعظام من جهة والنسبة التى من العدد اذ هو متناه من جهة اخرى غيرها ونسبة المتناهية تفرزها من الاشياء التى لا تتناهى فقط ونسبة المشتركة تفرزها من المتباينة وذلك ان تلك النسبة تحصّل اصغر[70] الاجزاء ولذلك تجعل كل ما حصلت فيه مشتركا وهذه تحصّل مرة اعظم الاجزاء ومرة اصغرها وذلك ان كل متناه | انما Pag. 9 تناهى بسبب النهاية التى هى اول النهايات ونعطى[71] ايضا لبعض المقادير النهاية بصورة ونعطيها لبعضها[72] بصورة اخرى فهذا ما ينبغى ان نحتجّ به فى هذه الاشياء

§ 9 ولما كان عدم المنطق يحدث على ثلث جهات اما على جهة التناسب
واما على جهة التركيب واما على جهة القسمة فانا ارى اولا ان هذا امر
يستحق ان تتعجب منه وهو ان قوة الثلثة[73] الضابطة للكل[74] كيف
تميز وتحدد[75] الطبيعة الصماء فضلا عن غيرها وتبلغ[76] الى الاواخر
ويشرق[77] الحد الماخوذ منها على[78] جميع الاشياء ثم بعد ذلك ان كل واحد
من هذه الثلثة الاصناف[79] يميزه لا محالة احد[80] التوسطات فاحدها يميزه
التوسط الهندسى والاخر[80] التوسط العددى والثالث التوسط التاليفى
ويشبّه[81] ان يكون جوهر النفس اذا حال فى طبيعة الاعظام من قرب على
حسب ما يوجبه ما فيها من معانى التوسطات وميز وحصل[82] كل ما كان
فى الاعظام غير محدود ولا محصّل وصورها من جميع الجهات ضبط عدم
تناهى الصم فهذه الثلثة رباطات لئلا يُغْلَب[83] شىء من الاواخر فضلا عن
غيرها من النسب[84] الموجودة فيه[85] لكنه متى بعد عن واحد منها[85] من
تلقاء طبيعة عاد[86] من الراس الى غيره وصار الى تشابه النسب النفسانية
فيها[87] كان فى الكل من قوة غير منطقة او اجتماع ملتأم من اشياء كثيرة
Pag. 10 اجتمعت بغير تحديد[88] او عدم | ما غير مصور بالطريق الذى يقسم الصور
فانها كلها تضبط بالنسب الحاصلة فى النفس فيتصل وياتلف التباين اذا ظهر
فى الكل عن قسمة الصور بالتوسط التاليفى ويتميز عدم تحديد التركيب
بحدود الاعداد المميّزة بالتوسط العددى ويستوى جميع اصناف الصم المتوسطة
الحادثة فى القوى الصم بالتوسط الهندسى ففيما ذكرنا من هذا كفاية

§ 10 ولان المؤثرين للنظر فى علم فلاطن يظنون ان التحديد الذى ذكره فى
كتابه المسمى ثااطيطس فى الخطوط المستقيمة المشتركة فى الطول والقوة

والمشتركة فى القوة فقط غير موافق[89] اصلا لما برهنه اقليدس فيها راينا ان تقول فى ذلك بعض القول وهو ان ثاطيطس لما حادثه[90] ثاوذورس فى براهين القوى المشتركة والمتباينة فى الطول بقياسها الى القوة التى مقدارها مقدار قدم التجأ الى حد مشترك لهذه كالمنتبه على العلم اليقينى بالطبع فقسم العدد كله قسمين ووجد احد القسمين متساويا مرارا متساوية والاخر يحيط به ابدا ضلع اطول وضلع اقصر وشبه الاول بالشكل المربع والثانى بالمستطيل وحكم على القوى التى تربع العدد المتساوى الاضلاع انها مشتركة فى القوة والطول وان التى تربع العدد المستطيل مباينة للاول بهذه الجهة الا ان بعضها على حال مشارك لبعض بجهة من الجهات واما اقليدس فلما امعن قليلا فى المقالة وحصل الخطوط المشتركة فى الطول والقوة وهى التى نسبة قواها بعضها الى بعض كنسبة عدد مربع الى عدد مربع بين ان كل ما كانت هذه حاله من الخطوط مشتركة فى الطول ابدا[91] وليس يخفى علينا الفرق بين هذا من قول اقليدس وبين القول الذى تقدم من قول ثاطيطس وذلك ان ليس المعنى فى تحصيل القوى | بالاعداد المربعة والمعنى Pag. 11
فى ان يكون لها نسبة كنسبة مربع الى مربع معنى واحدا لانه[92] ان كانت مثلا قوة مقدارها ثمنية عشر قدما واخرى ثمنية اقدام فمن البين ان نسبة الواحدة[93] الى الاخرى كنسبة عدد مربع الى عدد مربع وهما العددان اللذان هذان ضعفاهما وقد تحصّلان[94] بعددين مستطيلين واضلاعهما على مذهب اقليدس مشتركة فاما على مذهب[95] ثاطيطس فبعدان[96] من هذه الحال لانهما ليستا تربعان العدد المتساوى الاضلاع بل انما تربعان العدد المستطيل[97] فهذا فيما يحتاج الانسان[97] ان يقف عليه من هذه الاشياء

§ 11 وينبغى ان نقول ان كلام ثاطيطس لم يكن فى جميع القوى المشتركة فى الطول والمتباينة لكن فى القوى التى انما النسب لها بالقياس الى قوة ما منطقة اعنى القوة التى مقدارها قدم وذلك انه ابتدا الثاوذورس بالبحث عن القوة التى مقدارها ثلثة اقدام والقوة التى مقدارها خمسة اقدام من هذا الموضع فقال انهما غير مشاركتين[98] للقوة التى مقدارها قدم ولخص ذلك بان قال ان التى تربع العدد المتساوى الاضلاع قد حددنا انها طول والتى تربع المستطيل حددنا انها قوى من قبل انها فى الطول غير مشاركة لتيك اعنى للقوة التى مقدارها قدم والقوى المشاركة لهذه القوة فى الطول ومشاركة للسطوح التى تقوى عليها فاما اقليدس فان كلامه فى جميع القوى وليس انما كلامه بالقياس الى قوة ما مفروضة منطقة والى خط ما وليس يمكن ان نكون قد نبين بقول من الاقاويل ان القوى التى وصفنا مشتركة فى الطول وان لم تكن مشاركة للقوة التى مقدارها قدم ولم يكن ايضا العددُ المقدر للخطوط اعنى[99] عنها تصوّرت[100] هذه القوى منطقا فلذلك صار البحث عن ذلك معتاصا عند الذين يطلبون ان يحدّوا | للخطوط[101] Pag. 12
التى تقوى على هذه القوى قدرا معلوما على انه قد يتهيا للانسان اذا لزم برهان اقليدس ان يجدها مشتركة لا محالة لانه قد يتبين ان لها نسبة كعدد الى عدد فهذا مبلغ ما نقوله فى شك فلاطن

§ 12 ومن الاشياء التى اثبتها الفيلسوف ان هاهنا مقادير متباينة وانه ليس ينبغى ان نقبل ان الاشتراك موجود فى جميع المقادير كما هو فى الاعداد وانه متى لم يتفقد هذا[102] لزمه جهل كثير منكر من ذلك ما قاله الاثينى الغريب فى المقالة السابعة من كتاب النواميس وبعد هذه الاشياء

قد يوجد فى جميع الناس جهل قبيح بالطبع يضحك منه بجميع[103] الاشياء التى لها اطوال وعروض واعماق عند المساحة ومن البين انه قد يخلصهم من هذا الجهل التعاليم قال وذلك انى ارى ان هذا امر بهيمى لا انسانى وانى لاستحى لا لنفسى فقط لكن لجميع اليونانيين من ظن من يقدّم من الناس الظن الذى يظنه فى هذا الوقت الجمهور من ان الاشتراك لازم لجميع المقادير فانهم كلهم يقولون انا قد نعقل اشياء واحدة بعينها يمكن فيها بجهة من الجهات ان يكون بعضها يقدر بعضا وانما الحق فيها ان بعضها يقدر باقدار مشتركة وبعضها لا يقدر اصلا وقد تبين بالقول الذى فى الكتاب المعروف بثااطيطس بيانا كافيا كيف ينبغى ان تميز الخطوط المشتركة فى الطول والقوة بالقياس الى الخط المنطق المفروض اعنى[104] الذى مقداره قدم من الخطوط المشتركة فى القوة فقط ووصفنا ذلك فيما تقدم وقد يسهل علينا مما قيل فى الكتاب المعروف ثبتا ان نعلم انه قد وصف لنا ايضا الاختلاف الذى فى تركيب الخطوط المنطقة وذلك انه يقول اذا كان الخطان كلاهما منطقين | فقد يمكن ان يكون الكل مرة منطقا[105] ومرة غير منطق فان Pag. 13 الخط المركب من خطين منطقين فى الطول والقوة منطق لا محالة والخط المركب من خطين منطقين فى القوة فقط غير منطق

§ 13 وان كان ينبغى ان لا يجحده ما ذكره فى الكتاب المنسوب الى برمانيدس فقد بين[106] العلة الاولى فى قسمة الخطوط المشتركة والمتباينة وذلك انه وصف المساوى والاعظم والاصغر معا على الوضع الاول واخذ المشترك والمتباين فى هذا الموضع على انهما قائمان فى الوهم مع المقدار ومن البين ان هذه تمسك طبيعة الاشياء التى من شانها ان تقسم وتضبط الاجماع

والافتراق[107] التى فيها يقوى الله المطيفة بالعالم وذلك ان العدد[108] الالاهى من طريق ما يتقدم وجود قوام هذه الاشياء فهى كلها مشتركة بحسب تلك العلة لان الله يقدر الاشياء كلها اكثر مما يقدر الواحد[109] للعدد ومن طريق ان تباين الهيولى يلزم ان يكون هذه الاشياء وجدت فيها قوة التباين ويُشبّه ان يكون الحد اولى ان يستولى فى المشتركة لانه متولد عن القوة الالاهية وان يكون الهيولى تفضل[110] فى المقادير التى يقال لها المتباينة لانك ان اردت ان تعلم من اين دخل على المقادير التباين لم تجد[111] ذلك من شىء من الاشياء الا ما تتخيله من قسمة الاجزاء بالقوة الى ما لا نهاية والاجزاء لا محالة انما هى من الهيولى كما ان الكل من الصورة وما[112] بالقوة انما يوجد لجميع الاشياء من الهيولى كما ان ما بالفعل من المبدا الاخر فلم يوجد التباين اذًا للاعظام التى فى الهندسة من قبل الهيولى وعلى اى جهة يوجد الا لان الهيولى كما يقول | ارسطوطالس صنفان Pag. 14
احداهما[113] معقولة والاخرى محسوسة وذلك ان تخيل الجسم وبالجملة تخيل[114] البعد انما هو فى الصور الهندسية من قبل الهيولى المعقولة لان الموضع الذى يوجد فيه الصورة والحد فقط فهناك الاشياء كلها بلا ابعاد ولا اجزاء وهذه الصورة[115] كلها طبيعة[115] غير مجسمة والرسم والشكل والجسم وجميع ما للقوة المصورة التى فينا قد يشارك بضرب من الضروب الخاصة الهيولانية ولذلك صارت طبيعة الاعداد بسيطة وبرئة من هذا التباين من غير ان تتقدم الحيوة التى ليست بهيولانية فاما الحدود التى جرت من هناك الى التخيل والحدوث[116] الى هذا الفعل المصور فقد امتلات من عدم النطق وشاركت التباين وشانها بالجملة العوارض الهيولانية

ويبنغى ان نعود الى الشيء الذى قصدنا له وننظر[117] هل يمكن ان § 14
يكون خطوط ما منطقة مباينة للخطوط المفروضة[118] من اول الامر منطقا
وننظر بالجملة هل يمكن ان يكون قدر واحد بعينه منطقا واصم[119] فنقول
ان المقادير انما هى بالوضع لا بالطبع كما قلنا مرارا كثيرة ولذلك وجب
ضرورة ان ينتقل المنطق والاصم على حسب وضع العدد المفروض وليس
كما ان المتباين لا يجوز ان يكون مشتركا بوجه من الوجوه كذلك المنطق
لا يجوز ان يوجد اصم[120] اذ كانت المقادير قد تنتقل ولكن لما كان ينبغى
ان تكون خواص المنطقة وخواص الصم محدودة مجملة[121] فرضنا قدرا
واحدا وبينا بالقياس اليه خواص الاعظام المنطقة والصم لانا لو لم نجعل
تمييزنا لها بالقياس الى شيء واحد لكنا سمينا العظم الذى لا يقدره
المقدار المفروض منطقا لما كانت حدود هذا العالم[122] محفوظة عندنا مميزة
Pag. 15 | غير مضطربة بل كان الخط الذى نبين نحن انه موسط يحكم عليه غيرنا انه
ليس بان يكون موسطا اولى منه بان يكون منطقا اذا ما هو غير العدد
وهذا ليس هو طريقا علميا لكن ينبغى ان يكون خط واحد منطقا كما
يقول اقليدس

فليدع الخط المفروض منطقا وذلك انه ينبغى ان ناخذ خطا واحدا منطقا § 15
ويُسمى كل مشارك له فى الطول كان او فى القوة منطقا ويعكس احدهما
على الآخر ويضع ان المشارك للخط المنطق منطق والمنطق مشارك للخط
المنطق وذلك ان المباين لهذا الخط قد حده اقليدس بانه اصم فمن هاهنا
لا يجب ان ينسب جميع الخطوط المشتركة فى الطول وان كانت تسمى
منطقة الى الخط المفروض ولا يجب ان تسمى مشتركة على ان هذا الخط

يقدرها لكن متى كانت لها نسبة الى الخط المفروض اما فى القوة واما فى الطول سميت لا محالة منطقة وذلك ان كل واحد من الخطوط المشاركة للخط المفروض فى القوة او فى الطول منطق فاما كون هذه الخطوط مشتركة فى الطول او فى القوة فقط فمضاف اليهما من خارج وليس هو بحسب نسبتهما الى الخط المفروض وذلك ان الخطوط الموسطة ربما كانت[123] مشتركة فى الطول وربما كانت[123] مشتركة فى القوة فقط فلم يصب اذا[124] من قال ان جميع الخطوط المنطقة المشتركة فى الطول فانما[125] هى منطقة من قبل الطول ولذلك ليس يقدر جميع الخطوط المنطقة بالخط المفروض لا محالة فان الخطوط المشاركة فى القوة للخط المنطق المفروض قد تسمى على الاطلاق منطقة من ذلك انا لو اخذنا موضعين مربعين مساحة احدهما خمسون قدما والاخر ثمنية عشر قدما لكان الموضعان مشتركين[126] للمربع الذى من الخط المفروض منطقا ومقداره قدم وكان الخطان اللذان يقويان عليهما احدهما مشارك للاخر وهما مباينان للخط المفروض ولن يمنع مانع ان يسمى هذان الخطان منطقين مشتركين Pag. 16
فى الطول اما منطقين فلان المربعين اللذين منهما مشاركان للمربع الذى من المفروض واما مشتركين فى الطول فانه وان لم يكن العدد المشترك[127] لهما هو الخط المفروض منطقا فقد يقدرهما قدر اخر[128] فليس شىء من الاشياء اذا يجعل منطقا غير مشاركة الخط المنعلق المفروض[129] فاما الاعظام المشتركة فى الطول وفى القوة فقط فقد نجعلها كذلك القدر المشترك كائنا ما كان

§ 16 فاذ نبرهن ان الموضع الذى يحيط به خطان منطقان مشتركان فى الطول

منطق فليس يمنع مانع ان يكون الخطوط التى تحيط بالموضع[130] اما منطقة فمن قبل مجانستها للخط المنطق كيف كانت حالها عنده فى الطول او فى القوة فقط واما مشتركة فى الطول فمن قبل ان لهما لا محالة قدرا مشتركا وذلك انه ينبغى ان ننزل ان هاهنا خطين بهذه الصفة يحيطان بالسطح المفروض يسميان منطقين وهما مشتركان فى الطول الا انه ليس يقدرهما الخط المفروض منطقا لكن المربعين اللذين منهما مشاركين[130b] للمربع الذى من ذلك الخط فهذا الموضع[131] قد تبرهن انه منطق لانه مشارك لكل واحد من مربعى الخطين اللذين يحيطان به وقد كان ذانك مشاركين للمربع الذى من الخط المفروض فيجب ان يكون هذا السطح ايضا مشاركا له فهذا الموضع[132] اذًا منطق فان نحن اخذنا الخطين المفروضين فى الطول مشتركين على انهما غير مشاركين للخط المنطق من اول الامر لا فى الطول ولا فى القوة لم نتبين من وجه من الوجوه ان السطح الذى يحيطان به منطق ولكن ان انت جعلت الطول على العرض فوجدت عدد الموضع لم يكن بعد يثبت انه منطق مثال ذلك ان تكون نسبة الخطين اللذين يحيطان به نسبة الثلثة الى الاثنين Pag. 17
وذلك ان الموضع تكون مساحته[133] لا محالة ستة اشياء الا ان هذه الستة الاشياء ليس يعلم ما هى لان النصف والثلث فى الخطين انفسهما[134] قد كانا اصمين ولا ينبغى لاحد ان يقول ان الخطوط المنطقة صنفان منها ما يقدره الخط المنطق من اول الامر ومنها ما يقدره خط اخر ليس هو مشاركا لهذا الخط ولكن الخطوط المشتركة فى الطول صنفان منها ما يقدره الخط المنطق من اول الامر ومنها ما هى مشتركة وان كان يقدرها خط اخر غير مشارك لذلك الخط ولسنا نجد اقليدس فى موضع من المواضع

يسمى الخطوط المباينة فى كل واحدة من الجهتين للخط المفروض منطقا منطقة وما الذى كان يمنعه من ذلك اذ كان حكمه على الخطوط المنطقة ليس انما هو بالقياس الى ذلك الخط فقط لكنه قد كان يحكم عليها ايضا بان ياخذ قدرا ما اخر من الخطوط التى يقال لها المنطقة فينسبها[135] اليه

§ 17 فاما فلاطن فقد يجعل للخطوط المنطقة انفسها[136] اسماء مختلفة ونرى ان يسمى الخط المشارك فى الطول للمفروض منطقا طولا ويسمى المشارك له فى القوة فقط قوة واضاف الى ما قاله من ذلك السبب فقال لانه مشارك للخط المنطق بالسطح الذى يقوى عليه فاما اقليدس فيسمى الخط المشارك للمنطق كيف ما كانت مشاركته له منطقا من غير ان يشترط فى ذلك شيئا ولذلك صار سبب[137] حيرة للذين يجدون عنده خطوطا ما يقال لها منطقة وبعضها مع ذلك مشاركا لبعض فى الطول وهى مباينة للخط المفروض منطقا ولعله ليس يرى ان[138] يقدر جميع الخطوط المنطقة بالخط المفروض من اول الامر لكنه يرى ان يترك ذلك القدر وان

Pag. 18 كان فى الحدود قد يرى ان يَجْعَل نسبة المنطقة اليه وينتقل الى قدر اخر مباين للاول وقد يسمى امثال هذه الخطوط وَهُوَ لا يَشْعُرُ[139] منطقة لانها مشاركة للخط المفروض منطقا بوجه من الوجوه اعنى بالقوة فقط وينسب اشتراكها فى الطول الى قدر اخر يذهب فى ذلك الى ان[140] الاشتراك لها فى كل واحدة[141] من الجهتين والنطق ليس فى كل واحدة منهما

§ 18 وذلك ان[142] نقول ان من الخطوط المستقيمة خطوطا غير منطقة اصلا ومنها منطقة فغير المنطقة هى التى ليس اطوالها مشاركة لطول الخط المنطق ولا قواها مشاركة لقوته والمنطقة هى المشاركة للخط المنطق بوجه من

الوجوه وهذه المنطقة ايضا فمنها ما بعضها مشارك لبعض فى الطول ومنها ما هى مشاركة[143] فى القوة فقط والتى بعضها مشارك لبعض فى الطول منها ما هى مشاركة للخط المنطق فى الطول ومنهـا غير مشاركة له وبالجملة فكل خطوط منطقة مشاركة فى الطول للخط المنطق فبعضها مشارك لبعض وليس[144] كل منطقة فبعضها مشارك لبعض فى الطول فهى مشاركة للخط[144] المنطق والخطوط المشاركة للمنطق فى القوة ولذلك ما تسمى هى ايضا منطقة فمنها ما بعضهـا مشارك لبعض فى الطول لا بالقياس الى ذلك الخط ومنها ما هى مشتركة فى القوة فقط وذلك بين من انا ان انزلنا موضعا يحيط به خطـان منطقـان فى القوة مشاركان للخط المفروض واحدهما مشارك للاخر فى الطول صار هذا الموضع منطقا وان كان الموضع يحيط به خطان مشتركان ومشاركان للخط المنطق فى القوة فقط صار متوسطا فهذا مبلغ ما نقوله فى هذه الاشياء ومن البين ان الموضع الذى يحيط به خطان منطقان فى القوة مشتركان فان خطيه المنطقين مشتركان ومشاركان للمفروض منطقا فى القوة[145] فقط فاما الموضع الذى يحيط به خطان منطقان | فى الطول مشتركان Pag. 19
فان خطيه المنطقين مرة يكونان مشتركين ومشاركين للخط المنطق فى الطول ومرة يكونان مشاركين للمنطق فى القوة فقط ومشتركين بجهة اخرى

§ 19 والواجب ان يتامل هذا المعنى ايضا وهو انه لما وجد بالنسبة الهندسية الخط الموسط متوسطا بين خطين منطقين فى القوة فقط مشتركين ولذلك ما صار يقوى على الموضع الذى يحيطان به فان المربع الذى من الخط الموسط مساو للموضع الذى يحيط به الخطان الموضوعان عن جنبتيه وضع فى كل موضع الاسم العام للموسط على طبيعة جزءية لان الخط الموسط الذى

يقوى على الموضع الذى يحيط به خطان منطقان فى الطول مشتركان متوسط لا محالة لذينك[146] المنطقين والخط الذى يقوى على الموضع الذى يحيط به خط منطق وخط اصم على ذلك المثال ايضا ولكنه لا يسمى ولا واحد من هذين موسطا بل انما يسمى موسطا الخط الذى يقوى على الموضع المفروض وايضا فانه قد يشتقّ فى كل موضع اسم القوى من التى تقوى عليها فيسمى الموضع الذى من الخط المنطق منطقا والذى من الموسط موسطا

§ 20 وايضا فانه يشبه النظر فى الموسطات بالخطوط المنطقة وذلك انه يقول ان هذه الخطوط مثل تيك اما ان تكون مشتركة فى الطول او مشتركة فى القوة فقط وان الموضع الذى يحيط به موسطان مشتركان فى الطول موسط اضطرارا كما ان الموضع هناك الذى يحيط به منطقان مشتركان فى الطول منطق وللموضع ايضا الذى يحيط به موسطان مشتركان فى القوة فقط مرة يكون منطقا ومرة موسطا وذلك انه كما ان الخط الموسط يقوى على الموضع الذى يحيط به منطقان فى القوة مشتركان كذلك الخط المنطق ربما يقوى

Pag. 20 | على السطح الذى يحيط به خطان موسطان فى القوة مشتركان فيصير الموضع الموسط على ثلثة أنحاء اما ان يحيط به خطان[147] منطقان فى القوة مشتركان او موسطان فى الطول مشتركان او موسطان فى القوة مشتركان ويصير المنطق على جهتين اما ان يحيط به خطان[148] منطقان فى الطول مشتركان او خطان موسطان فى القوة مشتركان ويُشَبِّه ان يكون الخط الماخوذ فى النسبة فيما بين خطين موسطين فى الطول مشتركين والماخوذ فيما بين خطين منطقين فى القوة مشتركين من جميع الجهات موسطا والخط الماخوذ فيما بين خطين[149] موسطين فى القوة[149] مشتركين ربما كان منطقا وربما كان

موسطا ولذلك صارت القوة التى منه[150] ربما كانت منطقة وربما كانت موسطة وذلك انه قد يمكن ان يوجد خطان موسطان فى القوة مشتركين كما انه يمكن ان يكون خطان منطقان فى القوة فقط مشتركين فينبغى ان يكون السبب فى اختلاط المواضع التى يحيط بها الخطان الخط المناسب الذى فيما بين الطرفين الذى هو اما موسط فيما بين منطقين او موسط فيما بين موسطين او منطق فيما بين موسطين وبالجملة فربما شبه الرباط بالطرفين وربما جعله غير مشبه لهما ولكن فيما قلناه من هذه الاشياء كفاية

§ 21 وبعد نظره فى الخط الموسط واستخراجه اياه اخذ فى البحث لما اسمين عن الخطوط الصم فى التركيب والقسمة على حسب ما استعمل من البحث عن الاشتراك والتباين[151] وذلك ان الاشتراك والتباين[151] قد تجدهما فى الخطوط المركبة والمنفصلة وذو الاسمين يتقدم الخطوط التى بالتركيب

Pag. 21 | لانه ايضا اكثر الخطوط مجانسة للخط المنطق وذلك انه مركب من خطين منطقين فى القوة مشتركين والمنفصل يتقدم الخطوط التى بالتفصيل وذلك ان حدوث المنفصل ايضا انما يكون بان يفصل من خط منطق خط منطق[152] مشارك للكل فى القوة وذلك ان نستخرج الخط الموسط بان نضع ضلعا منطقا وقطرا مفروضا وناخذ خطا متوسطا فى النسبة بين هذين الخطين وذلك ان نستخرج ذا الاسمين بان نركب الضلع والقطر وذلك ان نستخرج المنفصل بان نفصل الضلع من القطر وقد ينبغى ان نعلم ايضا انه ليس متى يركب خطان فقط منطقان فى القوة مشتركان اخذنا الذى من اسمين لكن قد يحدث ذلك ايضا ثلثة خطوط واربعة على ذلك المثال اما اولا فقد يحدث الذى من ثلثة اسماء اذا كان الخط كله اصم[153] وثانيا

يحدث الذى[154] من اربعة اسماء ويمر ذلك بلا نهاية والبرهان على ان الذى من ثلثة خطوط منطقة فى القوة مشتركة[155] اصم هو بعينه البرهان الذى[155] تبرهن به على الخطين المركبين

§ 22 فقد[156] ينبغى ان نقول من الراس هكذا انه ليس انما يمكنا ان ناخذ خطا واحدا فقط متوسطا بين خطين فى القوة مشتركين بل قد يمكننا ان ناخذ ثلثة واربعة ويمر ذلك الى غير نهاية اذ كان قد يمكننا ان ناخذ فيما بين كل خطين مستقيمين مفروضين خطوطا كم شئنا على نسبة وفى[157] التى بالتركيب ايضا فليس انما يمكنا ان نعمل[158] خطا من اسمين فقط بل قد يمكننا ايضا ان نعمل الذى من ثلثة اسماء والذى من ثلثة موسطات الاول والثانى والذى من ثلثة خطوط مستقيمة متباينة فى القوة يصير احدها[159] مع كل واحد من الاثنين مجموع المربع الكائن منهما منطقا والقائم الزوايا الذى منهما موسطا حتى يصير الاعظم مركبا من ثلثة خطوط | ويسير على Pag. 22
ذلك المثال الخط الذى يقوى على منطق وموسط من ثلثة خطوط وكذلك الذى[160] يقوى على موسطين وذلك انا ننزل ثلثة خطوط منطقة فى القوة فقط مشتركة فالخط اذًا المركب من الاثنين اصم وهو الذى من اسمين فالموضع اذًا الذى من هذا الخط ومن الخط الباقى اصم والموضع ايضا الذى من هذين الخطين مرتين اصم فربع الخط كله المركب[161] من الثلثة الخطوط اصم فالخط اذًا اصم ويسمى من ثلثة اسماء واذا كانت اربعة خطوط كما قلنا مشتركة فى القوة جرى الامر فيها هذا المجرى بعينه وما يتلوا[162] ذلك فعلى هذا المثال فليكن ثلثة خطوط موسطة مشتركة فى القوة احدها مع كل واحد من الباقيين يحيطان بمنطق فالمركب[163] الذى منهما اذًا[164]

اصم [165] يسمى من موسطين الاول والخط الباقى موسط والموضع الذى منهما اصم [165] فربيع الكل اذًا اصم والحال فى سائر الاخر حال واحدة فالخطوط المركبة [166] اذًا فى جميع التى تكون بالتركيب تمر بلا نهاية

§ 23 وكذلك ليس ينبغى ان نقتصر فى الخطوط الصم التى بالتفصيل على ان نفصلها [167] انفصالا واحدا فقط حتى نجد الخط المنفصل او منفصل الموسط الاول او منفصل الموسط الثانى او الاصغر او الذى يجعل الكل موسطا مع منطق او الذى يجعل الكل موسطا مع الموسط لكنا نفصلها بفصلين وثلثة واربعة فانا اذا فعلنا ذلك بينا على ذلك المثال ان الخطوط التى تبقى صم [168] وان كل واحد منها واحد من الخطوط التى بالتفصيل اعنى انا اذا فصلنا من خط منطق خطا منطقا مشاركا للكل فى القوة كان لنا الخط الباقى منفصلا وان فصلنا من ذلك الخط المفصول المنطق الذى سماه اقليدس اللفق| خطا اخر منطقا مشاركا له فى القوة كان لنا [169] الجزء الباقى Pag. 23
منه منفصلا كما انا [169] ايضا ان فصلنا من الخط المنطق المفصول من ذلك الخط خطا اخر مشاركا له فى القوة صار الباقى منفصلا وكذلك الحال فى تفصيل سائر الخطوط فليس يمكن اذا الوقوف لا فى التى بالتركيب [170] ولا فى التى بالتفصيل لكنه يمر بلا نهاية اما فى تيك فبالزيادة واما فى هذه فبتنقيص الخط المفصول ويُشبَه ان يكون عدم نهاية الصم يظهر بامثال هذه الطرق من غير ان يقف التناسب فى كثرة محدودة للوسائط ولا ينتهى [171] التركيب بالمركبات ولا يتحصل الانفصال عند حد ما وقد ينبغى ان نكتفى بهذا [172] فى العلم بالمنطقة

§ 24 ونعود من الراس فنصف [173] جملها فنقول ان الجملة الاولى فى الاعظام

المشتركة والمتباينة وقد يتبين فيها ان هاهنا تباينا واى الاعظام هى المتباينة وكيف ينبغى ان تميز وما الاشتراك والتباين فى التناسب وانه يمكن ان ناخذ التباين على وجهين احدهما فى الطول والقوة والاخر فى الطول فقط وكيف حال كل واحد منها فى التركيب والتقسيم وكيف حالها فى الزيادة والنقصان وذلك ان بهذه الاشكال كلها وهى خمسة عشر شكلا افادنا العلم بالاعظام المشتركة والمتباينة

§ 25 والجملة الثانية ذكر فيها الخطوط المنطقة والموسطات المشارك بعضها لبعض فى القوة والطول وذكر المواضع التى تحيط بها هذه الخطوط وذكر[174] مجانسة الخط الاوسط للمنطق والفرق بينهما واستخراجه وما اشبه ذلك وذلك ان الامر فى انه ليس انما يمكنا فقط ان نجد خطين منطقين فى الطول مشتركين[175] بل وفى القوة ايضا بين انه قد يمكنا ان ناخذ خطين متباينين للخط المعلوم احدهما فى القوة والاخر فى الطول فقط فانا Pag. 24
ان اخذنا لخط مفروض منطقا خطا مباينا فى الطول كان لنا خطان منطقان مشتركان فى القوة فقط واذا اخذنا لهذين متوسطا فى النسبة كان لنا الخط الاصم الاول

§ 26 والجملة الثالثة يجعلها علة لاستخراج الصم التى تكون بالتركيب بان يقدم لاستخراجها خطين موسطين مشتركين فى القوة[176] فقط يحيطان بمن[طق] وخطين ايضا موسطين فى القوة مشتركين[176] يحيطان بموسط وخطين ايضا مستقيمين غير موسطين ولا منطقين متباينين فى القوة يجعلان المربع الذى منهما معا منطقا والسطح الذى يحيطان به موسطا وبعكس ذلك يجعلان المربع الذى منهما معا موسطا والسطح الذى يحيطان به

منطقا او يجعلان كل واحد من المربع والسطح موسطا ويكونان متباينين وذلك ان هذه الاشكال وجميع ما حصل فى الجملة الثالثة انما اخذ من اجل استخراج الخطوط الصم التى تكون بالتركيب لانه اذا ركب الخطوط المستخرجة فاحدث منها تلك الخطوط الصم

§ 27 والجملة الرابعة يفيدنا فيها الستة الخطوط الصم بالتركيب والتركيب ربما كان من خطين منطقين فى القوة مشتركين وذلك ان الخطين المشتركين فى الطول اذا تركبا جعلا الخط كله منطقا وربما كان من خطين موسطين مشتركين فى القوة وذلك ان الموسطين ايضا المشتركين فى الطول تكون جملتهما خطا موسطا وربما كان من خطين على الاطلاق[177] ومتباينين فى القوة[177] وثلثة من هذه صم للسبب الذى ذكرنا واثنان من الموسطين المشتركين فى القوة وواحد من منطقين مشتركين فى القوة فجميع ذلك ستة وبسبب هذه التى ثبتت فى الجملة الرابعة احدثت الجملة الثالثة | فهذه Pag. 25 الجملة الرابعة افادنا فيها تركيب الخطوط الستة الصم بان جعل بعضها من خطوط مشتركة فى القوة وهى الثلثة الاولى[178] وبعضها من متباينة فى القوة وهى الثلثة الثانية وفى كل واحد من هذه اما ان ياخذ المربع المركب من مربعيهما منطقا والسطح الذى يحيطان به موسطا او بعكس ذلك ياخذ المربع الذى من مربعيهما موسطا والسطح الذى يحيطان به[179] منطقا او ياخذ المربع الذى منهما موسطا والسطح الذى يحيطان به[179] موسطا ويكونان متباينين لانهما ان كانا مشتركين صار الخطان المركبان فى الطول مشتركين ويبين ايضا عكس تيك الاشكال بضرب من الضروب وهو ان كل واحد من هذه الستة الصم انما ينقسم على نقطة واحدة فقط وذلك

انه يبين ان الخطين ان كانا منطقين فى القوة مشتركين فان الخط المركب منهما من اسمين وان كان هذا الخط من اسمين فانه مركب من هذين فقط لا من غيرهما وكذلك يجرى القياس فى الخطوط الباقية ففى هذه الجملة ستتان من الأشكال الستة الاولى تركيب الستة الخطوط الصم والثانية تبين انعكاسها

§ 28 وجملة الخامسة مع هذه الجمل يستخرج فيها الخط الذى من اسمين وهو اول الخطوط التى بالتركيب وهو مصرف على ستة انحاء وهذا امر لست اظن به[180] انه فعله باطلا بل انما استعده للعلم باختلاف الستة الخطوط الصم التى بالتركيب الذى يمكن ان يوقف عليه خاصة من المواضع التى تقوى عليها

§ 29 وكذلك تتبع هذه الجملة بالجملة السادسة التى يبحث فيها عن هذه المواضع ويبين ان الذى من اسمين يقوى على موضع يحيط به خط منطق والخط الذى من اسمين الأول وان الخط الذى من موسطين الاول يقوى

Pag. 26 على موضع يحيط به خط منطق والذى من اسمين الثانى وما يتلوا | ذلك على هذا المثال فهذه الخطوط اذًا تحدث ستة مواضع يحيط بها خط منطق وواحد من الستة التى من اسمين

§ 30 وجملة السابعة يذكر فيها امر الاشتراك الذى[181] بين الستة الخطوط الصم التى بالتركيب ويتبين ان الخط المشارك لكل واحد من هذه الخطوط فهو من نوعه ولما اضاف ايضا قواها الى الخطوط المنطقة بحث عن عروض مواضعها واستخرج ستة اخرى بعكس الستة التى ذكرها فى الجملة السادسة

§ 31 والجملة الثامنة استخرج فيها اختلاف الستة الصم التى بالتركيب من المواضع التى تقوى عليها وبين مع ذلك تبينا واضحا من تركيب السطح

المنطق والموسط او من الموضعين الموسطين تميز الخطوط الصم التى بالتركيب[182] التى لبعضها عند بعض[182]

§ 32 وبعد هذه الاشياء وصف فى الجملة التاسعة الستة الخطوط الصم التى تكون بالتفصيل على مثال ما وصف الستة التى بالتركيب فجعل المنفصل نظير الذى من اسمين وذلك ان الخطين اللذين ركب منهما الذى من اسمين بهما ظهر المنفصل بتفصيل الاصغر من الاعظم وجعل منفصل الموسط الاول نظير الذى من موسطين الاول ومنفصل[183] الموسط الثانى نظير الذى من موسطين الثانى والاصغر للاعظم والذى يجعل الكل مع منطق موسطا[184] للذى يقوى على منطق وموسط والذى يجعل الكل مع موسط موسطا للذى يقوى على موسطين والسبب فى وضع اسمائها بين وكما بين فى التى[185] بالتركيب ان كل واحد منها هو منقسم على نقطة احدة كذلك بين بعقب هذه فى[186] التى بالتفصيل ان لفق كل واحد منها واحد

Pag. 27 § 33 وبين فى الجملة العاشرة خطوطا منفصلة مستخرجة على مثال ما | استخرج الذى من اسمين حتى يحد فصول هذه الستة الخطوط الصم

§ 34 وذلك انه يتبع هذا بان يبين فى الجملة الحادية عشرة[187] الستة الخطوط[188] الصم التى بالتفصيل التى تقوى على موضع يحيط به خط منطق وواحد من الخطوط[188] المنفصلة التى هى ايضا ستة على ترتيبها

§ 35 ولما بحث عن هذا فى الجملة الحادية عشرة[189] وصف فى الجملة الثانية عشرة[190] امر الاشتراك الذى فيما بين هذه الستة الصم وبين ان المشارك لكل واحد منها فهو مشاركه فى النوع لا محالة ووصف ايضا الاختلاف

الذى لبعضها عند بعض وهو الاختلاف الذى يبين من[191] المواضع التى اذا اضيفت[192] الى المنطق جعلت العروض مختلفة

§ 36 ولما صار الى الجملة الثالثة[193] عشرة بين ان الخطوط الستة[194] الصم التى بالتركيب مخالفة للخطوط التى بالتفصيل وان هذه التى بالتفصيل بعضها مخالف لبعض وميّزها ايضا من تفصيل المواضع كما ميز الخطوط التى بالتركيب من تركيب وذلك انه لما فصل سطحا موسطا من سطح منطق او سطحا منطقا من سطح موسط او سطحا موسطا من سطح موسط وجد الخطوط التى تقوى على هذه السطوح وهى الصم التى[195] بالتفصيل واخر ذلك لما اراد ان يظهر عدم التناهى الذى فى الصم وجد خطوطا بلا نهاية مختلفة فى النوع حادثة عن الخط الموسط وجعل هذا المعنى انقضاء هذه المقالة وترك الصمم يمر بلا نهاية

تفسير المقالة العاشرة

من كتاب اوقليدس

في الأصول

§ 1 الذى ينبغى ان نعلمه فى نظام الصم بايجاز هو هذا اما اولا فان اقليدس افادنا المنتظمة منها والمجانسة للمنطقة وذلك ان الصم منها ما هى غير منتظمة وهى من حيزالهيولى التى يقال لها المحوزة وتخرج بلا نهاية ومنها ما هى منتظمة ويحيط بها علم ونسبتها الى تيك نسبة المنطقة[196] اليها واوقليدس انما عنى[197] بالمنتظمة المجانسة للمنطقة التى ليس خروجها عنها خروجا كثيرا فاما ابلونيوس يعنى بغير المنتظمة التى البعد بينها وبين المنطقة بعد كثير

§ 2 ثم بعد ذلك ينبغى ان نعلم ان الصم وجدت على ثلث جهات اما بالتناسب واما بالتركيب واما بالتفصيل ولم توجد على جهة اخرى غير

Pag. 30 هذه الثلث جهات اصلا وذلك ان غير المنتظمة انما اخذت من المنتظمة باحدى[198] هذه الجهات واوقليدس انما وجد خطا واحدا اصم[199] بالتناسب وستة بالتركيب وستة بالتفصيل وعند ذلك تمّ[200] جميع عدد الصم المنتظمة

§ 3 وثالثا بعد هذين ينبغى ان ننظر فى جميع الصم من المواضع التى تقوى عليها وجميع الاختلافات التى لبعضها عند بعض من هذه ينبغى ان يوخذ وان ننظر اى المواضع التى يقوى عليها واحد واحد منها على انها اجزاء وانما هى التى تقوى عليها على انها كليات وذلك انا نجد الموسط على هذه الجهة يقوى على موضع يحيط به خطان منطقان فى القوة مشتركان وكذلك نجد كل واحد من الاخر ولذلك يصف اضافات القوى ايضا فى واحد واحد[201] منها ويستخرج[202] عروض المواضع واخر ذلك يركب كالمجدّ[203] فى اظهار غرضه المواضع انفسها فتقوم الصم التى بالتركيب فانه اذا ركب منطق[204] وموسط حدث اربعة خطوط صم واذا تركب موسطان حدث الخطان الباقيان وذلك ان هذه الخطوط ايضا قد تسمى مركبة من قبل تركيب المواضع وكذلك تسمى التى بالتفصيل منفصلة[205] من قبل تفصيل المواضع التى تقوى عليها والموسط ايضا انما سمى موسطا لان المربع الذى منه مساو للموضع الذى يحيط به خطان منطقان فى القوة مشتركان

§ 4 فاذ قد قدمنا واوطانا هذه الاشياء فينبغى ان نقول ان كل موضع[206] قائم الزوايا فانه اما ان يكون يحيط به خطان منطقان او خطان اصمان او خط منطق وخط اصم وانه ان كان الخطان اللذان يحيطان به منطقين

Pag. 31 فهما اما مشتركان فى الطول او مشتركان فى القوة فقط[207] وان كان كلاهما

اصمين فهما اما ان يكونا مشتركين فى الطول او مشتركين فى القوة فقط[207]
او متباينين فى الطول والقوة وان كان احدهما منطقا والاخر اصم فهما
لا محالة متباينين فان كان يحيط بالموضع المفروض خطان منطقان فان
المنطقين ان كانا فى الطول مشتركين فالموضع منطق كما بين المهندس
ان الموضع يحيط به منطقان فى الطول مشتركان منطق وان كانا فى القوة
فقط مشتركين فان الموضع اصم ويسمى موسطا والخط الذى يقوى عليه
موسط وهذا ايضا قد بينه المهندس اعنى ان القائم الزوايا الذى يحيط به
منطقان فى القوة مشتركان اصم والخط الذى يقوى عليه اصم وليدع موسطا
وان كان الخطان المحيطان بالموضع اصمين فقد يجوز ان يكون الموضع
بحال من الاحوال منطقا ويجوز ان يكون اصم وذلك ان الخطين ان كانا
فى الطول مشتركين فالموضع لا محالة اصم كما بين فى الموسطة وهذه الجهة
من البرهان يوجد فى جميع الصم وان كانا مشتركين فى القوة فقد يمكن
ان يكون منطقا ويمكن ان يكون اصم فانه قد تبين ان الموضع الذى يحيط
به خطان موسطان فى القوة مشتركان اما ان يكون منطقا واما اصم واذا
كانا متباينين من جميع الوجوه فقد يكون الموضع[208] الذى يحيطان به
منطقا ويكون اصم وذلك انه قد وجد خطين مستقيمين متباينين فى القوة
يحيطان بمنطق ووجد اخرين على ذلك المثال[209] يحيطان بموسط وهما ايضا
متباينين فى القوة وهذا هو المعنى فى ان يكون الخطوط متباينة من جميع
الوجوه لان المتباينة فى القوة هى لا محالة متباينة فى الطول ايضا

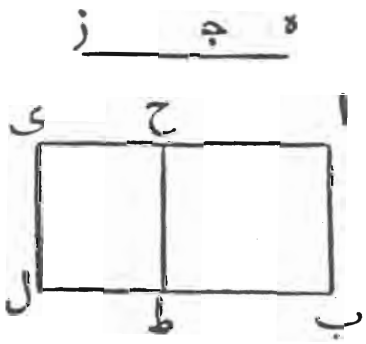
§ 5 فالخط الموسط وجده بالتناسب الهندسى يقوى على موضع موسط وهذا

Pag. 32 الموضع[210] مساو للموضع الذى يحيط به خطان منطقان فى القوة مشتركان ولذلك ما سماه بهذا الاسم

§ 6 فاما الستة الصم التى بالتركيب فبينها من تركيب المواضع التى تقوى عليها وهذه المواضع منطقة وموسطة وذلك انه كما انا نجد الخط الموسط بالمنطقة وحدها كذلك نجد الخطوط الصم التى بالتركيب بكلى هذين الامرين اعنى بالمنطقة والموسطة لانه ينبغى دائما ان يكون الصم التى هى اقرب الى المنطقة تفيدنا مبادى علم[211] التى هى ابعد منها لانا ايضا انما نجد الخطوط التى بالتفصيل بالخطوط التى بالتركيب ولكن هذه سنصفها[212] باخرة ولكن نجد الخطوط التى بالتركيب باخذ خطين مستقيمين فليس يخلوا من ان يكونا اما مشتركين فى الطول او مشتركين فى القوة فقط او متباينين فى القوة والطول وليس يمكن اذا كانا مشتركين فى الطول ان يستعملا فى وجود سائر الصم الباقية لان جملة الخط المركب من خطين مشتركين فى الطول مساوية فى النوع للخطين المركبين فان كانا منطقين فجملتهما ايضا منطقة وان كانا موسطين فهى موسطة وذلك انه متى تركب عظمان مشتركان فان جملتهما مشاركة لكل واحد منهما والمشارك للمنطق منطق والمشارك للموسط موسط

§ 7 فواجب ضرورة ان يكون الخطان المركبان اما مشتركين فى القوة او متباينين فى القوة والطول فليكونا اولا مشتركين فى القوة ثم نستعمل القسمة من الراس فنقول اما ان يكون المجتمع من مربعيهما منطقا والموضع الذى يحيطان به موسطا او يكون كل واحد منهما موسطا او يكون المجتمع من مربعيهما موسطا والموضع الذى يحيطان به منطقا او يكون كل واحد

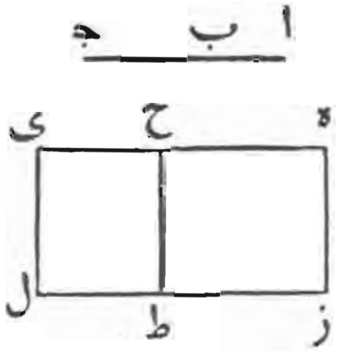
منهما منطقا ولكن ان كان كل واحد منهما منطقا فالخط باسره منطق
وليكن كل واحد منهما منطقا ولنضف الى خط منطق وهو اب
موضع[213] ال مساويا لمربع خط هز باسره ولنفرز منه موضع اط مساويا Pag. 33
للموضع المركب من مربعي هج جز فموضع طي الباقي اذًا مساو للموضع
الذي يحيط به هج جز مرتين فلان كل واحد من الموضعين المضافين الى



خط اب المنطق منطق فكل واحد من خطي اح حي منطق ومشارك
لخط اب في الطول فكل واحد منهما مشارك للاخر فاى باسره مشارك
لهما ولخط اب فموضع ال اذًا منطق[214] فيجب ان يكون المربع الذي من
هز ايضا منطقا فخط هز اذًا منطق[214] فليس ينبغي اذًا ان ناخذ كل واحد
منهما منطقا اعني المركب من مربعي هج جز والموضع الذي يحيطان به
فبقي اذًا ان يكون المركب من مربعيهما منطقا والذي يحيطان[215] به موسطا
او بعكس ذلك او ان[216] يكونا جميعا موسطين فان كان المركب الذي من
مربعيهما منطقا والذي يحيطان به موسطا فالخط باسره من اسمين يقوى على
موضعين منطق وموسط والمنطق اعظم من الموسط لانه قد تبين انه متى
قسم خط بقسمين مختلفين فان القائم الزوايا الذي يحيط به القسمان المختلفان

مرتين اقل من الموضع المركب من مربعيهما وان كان الامر بالعكس اعنى
ان يكون الموضع الذى يحيط به الخطان المفروضان المشتركان فى القوة
فقط منطقا والمركب من مربعيهما موسطا فالخط باسره اصم وهو الذى من
موسطين الاول وهو يقوى على موضعين منطق وموسط والموسط اعظم
من المنطق وان كان كل واحد منهما موسطا فان هذا هو الذى بقى اعنى
المركب من مربعيهما والذى يحيطان به فان الخط باسره اصم وهو الذى من
موسطين الثانى وهو يقوى على سطحين موسطين اقول ان هذين الموسطين
متباينان فان لم يكونا كذلك فليكونا مشتركين فان كان[217] المجتمع من مربعى Pag. 34
اب بج[218] مشاركا للذى يحيط به اب بج لكن المركب من مربعى اب بج
مشارك لمربع اب وقد كان مربع اب مشاركا لمربع بج لانه قد فرض خطا
اب بج بالقوة مشتركين ومتى تركب خطان مشتركان فان مجموعهما
مشارك لكل واحد منهما فمربع اب اذًا مشارك للذى يحيط به اب بج
ونسبة مربع اب الى الموضع الذى يحيط به اب بج كنسبة خط اب الى
خط بج فخط اب اذًا مشارك فى الطول لخط بج وذلك ما لم يفرض لانهما
مشتركين فى القوة فقط فالمركب اذًا من مربعى اب بج باضطرار مباين
للقائم الزوايا الذى يحيطان به فهذه اذًا ثلثة خطوط صم تحدث اذا كان
الخطان المفروضان مشتركين فى القوة

§ 8 وقد تحدث ثلثة اخر اذا كانا متباينين فى القوة وليكن اب بج متباينين
فى القوة فاما ان يكون المركب من مربعيهما منطقا والقائم الزوايا الذى
يحيطان به منطقا او يكونا كلاهما موسطين او يكون احدهما منطقا والاخر
موسطا وهذا على جهتين كالحال فى الخطين المشتركين فى القوة ولكن ان



كان المركب من مربعي اب بج منطقا والذي يحيطان به منطقا فالخط باسره
منطق وليفرض ايضا خط منطق وليضف اليه موضع مساو لمربع اج وليفرز
من هذا الموضع موضع مساو للمركب من مربعي اب بج وهو موضع هط
فحل الباقي اذًا مساو للقائم الزوايا الذي يحيط به اب بج[219] مرتين فهط حل
اذًا منطقان وقد اضيفا الى خط هز المنطق فكل واحد منهما اذًا يحدث
عرضا منطقا مشاركا لخط هز فهح وحى اذًا مشتركان فهي مشارك لكل
واحد منهما فهو اذًا منطق ومشارك في الطول لخط هز والقائم الزوايا
الذي يحيط به خطان منطقان في الطول مشتركان منطق فموضع هل اذًا Pag. 35
منطق فمربع اج منطق فاج منطق وذلك ان الخط الذي يقوى على منطق
منطق فلانا نلتمس ان نبرهن ان الخط باسره اصم فليس ينبغي لنا ان
ناخذ كل واحد من الموضعين منطقا لكنه ينبغي ان ناخذهما اما موسطين
كليهما[220] او احدهما منطقا والاخر موسطا ويكون هذا على جهتين وذلك
انه اما ان يكون الاعظم هو المنطق او الموسط اذ ليس يتهيا ان يكونا
متساويين لئلا يكونا مشتركين ويكون المنطق موسطا والموسط منطقا فان
كان المركب من مربعي اب بج منطقا وكان القائم الزوايا الذي من اب بج

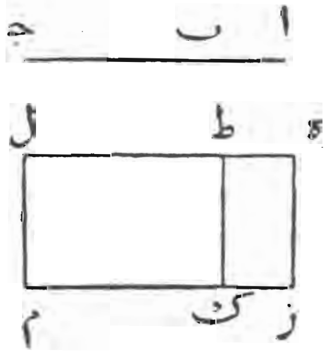
موسطا فليدع اجـ الاعظم لان المنطق هو الاعظم وان كان الامر بالعكس فكان المركب من مربعى اب بجـ موسطا والقائم الزوايا الذى يحيط به[221] اب بجـ منطقا فليدع اجـ اصم يقوى على منطق وموسط وذلك انه ينبغى ان يسمى من كل واحد من الموضعين اما من المنطق فلانه افضل بالطبع واما من الموسط فلانه فى هذا الموضع الاعظم وان كان الموضعان كلاهما موسطين فليدع الخط باسره اصم يقوى على موسطين وفى هذا الموضع ايضا تزيد اقليدس فى قوله ان الموسطين متباينان

§ 9 فان الصم بالتركيب ليس ينبغى لنا ان نظن انهما تركيبان خطوط بل تركيبات المواضع التى تقوى عليها وهذا شىء قد صرح به[222] اقليدس الا قليل[223] فى اخر المقالة حيث بين انه اذا تركب موضع منطق وموسط حدث عنهما اربعة خطوط[224] صم واذا تركب موسطان حدث الاثنان الباقيان فهو بين عندنا ان الخطين اذا كانا مشتركين فى القوة حدث ثلثة خطوط ضرورة واذا كانا متباينين فى القوة حدث ثلثة وذلك انه ليس يمكن ان يكونا مشتركين فى الطول ولكنه واجب ان تطالب لِمَ لمّا[225] وصف المشتركة[226] فى القوة ذكر نوعها ايضا فقال منطقين فى القوة Pag. 36 مشتركين او موسطين والمتباينة فى القوة لما وضعها لم يسمها[227] منطقة او موسطة وقد كان ينبغى ان يقول فى ذلك ايضا على مثال ما قال فى هذه متى تركب خطان مستقيمان فى القوة مشتركان فجعلا المركب من موضعيهما[228] موسطا والذى يحيطان به منطقا[228] فالخط باسره اصم ويدعى من موسطين الاول وكذلك فى الذى من موسطين الثانى وذلك انه هكذا قال فى المتباينة فى القوة ايضا من غير ان يسميها موسطة او منطقة لكنه انما يظن فى

المواضع فقط اعنى المركب من مربعيها والذى يحيطان به واخذهما اما موسطين جميعا واما احدهما منطقا والاخر موسطا والاعظم منهما اما المنطق واما الموسط فاقول احسب بان اقليدس يرى ان الخطين متى كانا فى القوة مشتركين وكان الموضع المركب من موضعيها منطقا فان مربع كل واحد منهما منطق وان كان المركب من مربعيها[229] موسطا فان مربع كل واحد منهما موسط وان كانا فى القوة متباينين وكان المركب من مربعيها[229] منطقا لم يكن مربع كل واحد منهما منطقا وان كان المركب من مربعيها موسطا لم يكن مربع كل واحد منهما موسطا ولذلك لما اخذ المشتركة فى القوة سماها منطقة او موسطة لان الخطوط التى تقوى على المواضع المنطقة منطقة والتى تقوى على الموسطة موسطة ولما اخذ المتباينة فى القوة لم يَحْتَجِ ان يسميها منطقة او موسطة لانه انما ينبغى ان يسمى منطقين الخطين اللذين كل واحد منهما يقوى على منطق لا اللذين[230] المركب من مربعيها منطق ومربعاهما[231] ليسا منطقين لان الموضع المنطق ليس ينقسم لا محالة الى موضعين منطقين ويسمى موسطين الخطين اللذين كل واحد منهما يقوى على موسط لا اللذين المركب | من مربعيهما موسط ومربعاهما[232] ليسا موسطين Pag. 37
لان الموضع الموسط ليس ينقسم لا محالة الى موضعين موسطين

§ 10 اما المعنى الذى اراده فهذا ولكنه يحتاج الى برهان انه متى كان خطان مشتركان فى القوة وكان المركب من مربعيهما منطقا او موسطا فانهما يكونان منطقين او موسطين فان كانا متباينين فى القوة لم يكن هذا القول فيهما صادقا وليكن خطا اب بج فى القوة مشتركين[233] وليكن المركب من مربعيهما منطقا فاقول ان هذين منطقان[234] فلان خط اب فى القوة مشارك

لخط بج فمربع اب مشارك لمربع بج فالمركب من الاثنين مشارك لكل واحد منهما والمركب من الاثنين منطق فكل واحد منهما منطق فخطا اب بج[235] اذًا منطقان مشتركان فى القوة وليكن ايضا المركب موسطا اقول ان هذين الخطين موسطان . فلان اب بج فى القوة مشتركان فمربعاهما مشتركان فالمركب من هذين مشارك لكل واحد منهما والمركب من المربعين موسط فمربعا[236] اب بج اذًا موسطان فهما ايضا موسطان لان المشارك للمنطق منطق والمشارك للموسط موسط والخط الذى يقوى على المنطق منطق[237] والذى يقوى على الموسط موسط فان كان مربعا اب بج موسطين فان المركب منهما موسط وان كان المركب منهما موسطا فهما موسطان اذ كان اب بج فى القوة مشتركين[238] ولكن . فليكونا متباينين فى القوة اقول انه ليس ان كان المركب من مربعيهما منطقا فهما منطقان ولا ان كان موسطا فهما موسطان فان كان ذلك ممكنا فليكن مربعا اب بج منطقين وليضف[239] الى خط منطق وهو هز | موضع مساو للمركب من Pag. 38



مربعى اب بج وهو هم وليفصل منه موضع مساو لمربع اب وهو هك فالباقى اذًا وهو طم مساو لمربع[240] بج فلان مربع اب مباين لمربع بج

لانهما فى القوة متباينان فبين ان هك مباين لطم فخط هط اذًا مباين فى الطول لخط طل ولان مربعى اب بج منطقان فوضعا هك طم منطقان وقد اضيفا الى خط هز المنطق فخطا هط[241] طل اذًا منطقان فى القوة فقط مشتركان لأن موضع هك مباين لموضع طم فخط هط مباين فى الطول لخط طل[242] فخط هل اذًا من اسمين فهو اذًا اصم ولكن موضع هم منطق لانه مساو للمركب من مربعى اب بج وهو منطق وقد اضيف الى خط هز المنطق فخط هل اذًا منطق فهو اذًا بعينه منطق واصم فليس اذًا مربعا اب بج منطقين وليكن ايضا المركب من مربعى اب بج المتباينين فى القوة موسطا اقول ان مربعى اب بج ليسا موسطين فان كان ذلك ممكنا فنفرض هز منطقا وليكن الموضعان بعينهما موسطين[243] فكل واحد من خطى هط طل منطق[244] وهما فى القوة مشتركان فخط هل اذًا من اسمين فهو اذًا اصم لكنه منطق وذلك ان المركب من مربعى اب بج موسط وقد اضيف الى هز المنطق فاحدث عرضا منطقا فليس اذًا مربعا اب بج موسطين فقد تبين اذًا ان الخطين المتباينين فى القوة ليس اذا كان المركب من مربعيهما منطقا او موسطا فهما ايضا منطقان او موسطان فلما بين اوقليدس ان ذلك فى المشتركة فى القوة حق وفى المتباينة فى القوة ليس بحق سمى تلك المشتركة فى القوة منطقة وموسطة ولم يسم هذه لكنه سماها متباينة فى القوة على الاطلاق

§ 11 فلان القسمة التى من اول الامر انما ياخذ الخطوط المشتركة فى القوة
Pag. 39 | والمتباينة فى القوة يستخرج بها الخطوط الصم تركيب المواضع اما المنطقة والموسطة[245] واما الموسطة المتباينة لانه قد ينبغى بهذين الموضعين من

قبل انهما يتولدان من المنطقة فمتى كان الخطان اللذان يحيطان بالموضع منطقين فاما ان يكونا كذلك فى الطول فيكون الموضع الذى يحيطان به[246] منطقا واما ان يكونا كذلك فى القوة فيكون الذى يحيطان به[246] موسطا فلذلك استخرج[247] الستة الصم التى بالتركيب من احاطة الخطوط[247] المنطقة احد هذين الموضعين فليكف[248] بما وصفناه فى الصم التى بالتركيب اذ قد بينا ترتيبها وعددها من القسمة

§ 12 وقد نجد الستة التى بالتفصيل من التى بالتركيب لانا اذا نظرنا الى كل واحد من الخطوط الصم التى وصفنا فجعلنا حال احد الخطين اللذين ركب منهما الى الاخر كحال خط ما باسره الى جزء منه فان الفضل الباقى منه يحدث واحدة من هذه الستة الصم فمتى احدث الخط المستقيم باسره مع جزء منه الخط الذى من اسمين حدث المنفصل ومتى احدث الذى من موسطين الاول حدث[249] منفصل الموسط الاول ومتى احدث الذى من موسطين الثانى حدث منفصل الموسط الثانى ومتى احدث الاعظم حدث الاصغر ومتى احدث الذى يقوى على منطق وموسط حدث الذى يصير[250] الكل مع منطق موسطا ومتى احدث الذى يقوى على موسطين حدث الذى يصير الكل مع موسط موسطا وعلى هذا الوجه تبين ان تولد هذه من تلك الستة وانها نظائر لها وان التى بالتفصيل مجانسة للتى بالتركيب

Pag. 40 فالمنفصل[251] مجانس للذى من اسمين ومنفصل | الموسط الاول مجانس للذى من موسطين يحيطان بمنطق ومنفصل الموسط الثانى مجانس للذى من موسطين يحيطان بموسط والباقية من هذه نظيرة للباقية من تيك على هذا المثال

§ 13 وليس ينبغى ان نظن فى الصم التى بالتفصيل[252] انا انما نسميها

منفصلة[253] من قبل انفصال جزء من الخط من جملته كما انا لم نسم الستة التى بالتركيب مركبة من قبل تركيب الخطوط لكننا انما نسميها من قبل المواضع المنفصلة المنقوصة كما انا انما سمينا تلك الصم التى بالتركيب مركبة من قبل المواضع المركبة التى تقوى عليها ولنضع خط اب وليحدث مع بج الذى من اسمين فريعا اب بج مساويان للقائم الزوايا الذى يحيط به اب بج مرتين ومربع جا ولكن قد صار الذى من مربعى اب بج منطقا والذى يحيطان به موسطا فان انت اذًا نقصت من موضع منطق موضعا موسطا فان الخط الذى يقوى على الباقى المنفصل فكما انه اذا تركب موسط ومنطق وكان المنطق هو الاعظم امكن ان يحدث الذى من اسمين كذلك[254] اذا نقص من منطق موسط فان الخط الذى يقوى على الباقى المنفصل ولذلك سمينا الذى من اسمين بالتركيب والمنفصل بالتفصيل وذلك انا هناك ركبنا موسطا اصغر مع[255] منطق اعظم وهاهنا فصلنا من المنطق بعينه الموسط بعينه هناك وجدنا الذى يقوى على الكل وهاهنا وجدنا الذى يقوى على الباقى فنفصل اذًا والذى من اسمين متجانسان[255b] واحدهما يخالف الاخر وايضا اذا كان خطا اب بج فى القوة مشتركين وكان مجموع اللذين منهما موسطا والذى يحيطان به منطقا صار الموسط مساويا للمنطق مرتين[256] والذى من خط اج الباقى فبعكس ذلك فى هذا الخط ان نقص من موسط منطق فان | الذى يقوى على الباقى منفصل الموسط الاول لان المنطق اصغر[257] من الموسط فكما انا صيّرنا الذى من موسطين الاول بتركيب الموسط والمنطق على ان المنطق الاصغر والموسط الاعظم كذلك نقول ان منفصل الموسط الاول هو الذى يقوى على الموضع الباقى Pag. 41

بعد انفصال المنطق من الموسط وايضا اذا احدث اب بج الذى من موسطين الثانى وكان مجموع اللذين يكونان منهما موسطا[258] وكان مجموع الذى من اب بج اعظم من الذى يحيطان به مرتين فالذى من[259] خط اج فان انت فصلت من موسط موسطا وكان الخطان اللذان يحيطان بالموسط المفصول مشتركين فى القوة فان الخط الذى يقوى على الباقى منفصل الموسط الثانى وذلك انه كما ان الخط الذى يقوى على هذين الموضعين الموسطين اذا اخذنا بالتركيب كان يسمى الذى من موسطين الثانى كذلك الخط الذى يقوى على الباقى من انفصال الاصغر من الموسطين من الاكبر يسمى منفصل الموسط الثانى وايضا متى كان خطا اب بج بالقوة متباينين وكان المركب من مربعيهما منطقا والذى يحيطان به موسطا فان الموسط مرتين اذا فصل من المنطق بقى مربع اج فهو يسمى الاصغر كما ان ذلك يسمى الاعظم لان ذلك كان يقوى على موضعين[260] وهذا يقوى على الباقى بعد التفصيل فلذلك سمى هذا الاصغر لمقابلته لذلك الذى يسمى الاعظم وايضا ان كان المركب من مربعى اب بج موسطا والذى يحيطان به منطقا وانتزعت المنطق مرتين من الموسط الذى من مربعيهما فان الذى يقوى على الباقى بعد الانفصال هو خط اج[261] ويسمى الذى يصير الكل مع منطق موسطا لان مربعه اذا ركب مع القائم الزوايا الذى يحيط به خطا اب بج مرتين وهو منطق فمن البين انه مساو للمركب من مربعى اب بج وايضا اذا كان | Pag. 42 خطا اب بج فى القوة متباينين وكان الذى من مربعيهما موسطا والذى يحيطان به موسطا[262] وكان الموضعان متباينين ثم فصلنا الذى يحيطان به مرتين من الموسط الاعظم المركب من مربعيهما فان الخط الذى يقوى على

الباقى هو خط اجـ [263] ويسمى الذى يعمل الكل مع موسط موسطا وذلك ان مربعه والذى يحيط به اب بجـ مرتين اذا اخذا معا كانا مساويين للمركب من مربعى اب بجـ الذى هو موسط

§ 14 فاذا تركبت المواضع المنطقة مع الموسطة او الموسطة مع الموسطة فقد تبين ان الخطوط الصم التى تقوى على المركب منهما هى التى تسمى بالتركيب واذا فصلت مواضع موسطة من منطقة ومنطقة من موسطة وموسطة من موسطة فقد تبين لنا الخطوط الصم التى بالتفصيل وذلك انا فى هذه المواضع لسنا نفصل [264] منطقة من منطقة لئلا يكون الباقى منطقا لانه قد تبين ان المنطق [265] يفضل المنطق بمنطق [265] وان الخط الذى يقوى على المنطق منطق فان كان ينبغى ان يكون الخط الذى يقوى على الباقى من الانفصال اصم ويقوى على موضع اخر اصم بهذه الصفة فليس ينبغى ان يكون الموضع المنفصل من المنطق منطقا فبقى ان ننزع [266] اما منطق من موسط او موسط من منطق واما موسط من موسط ولكنا اذا فصلنا موسطا من منطق جعلنا الخطين اللذين يقويان على الباقيين اصمين فان كان المحيطان [267] بالموسط بالقوة مشتركين حدث المنفصل وان كانا فى القوة متباينين حدث الاصغر واذا نحن فصلنا منطقا من موسط [268] عملنا خطين اخرين ايضا فان كان الخطان اللذان [269] يحيطان بالمنطق والمفصول فى القوة مشتركين حدث منفصل الموسط الاول وان كانا فى القوة متباينين
Pag. 43 | حدث الذى يجعل الكل مع منطق موسطا واذا ما فصلنا من الموسط [270] موسطا فكان الخطان اللذان يحيطان بالموسط [271] فى القوة مشتركين فان الخط [272] الذى يقوى على [272] الباقى [273] هو منفصل الموسط الثانى وان

كانا فى القوة متباينين حدث[273] الذى يجعل الكل مع موسط موسطا لانا
لما الفنا[274] فى التركيب المواضع الموسطة مع المنطقة او المنطقة مع الموسطة
او الموسطة مع الموسطة احدثنا الخطوط الستة الصم فقط فى كل واحد
اثنان[275] فضرب الاخذ بالتركيب التى تحيط بالمواضع الصغرى وتقوى على
المواضع العظمى واخذناها مرة فى القوة مشتركة ومرة فى القوة متباينة

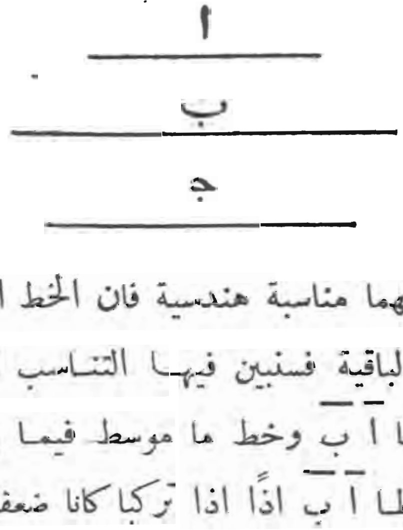
§ 15 ونحن نقول جملةً ان الموسط اذا تركب مع منطق جعل الذى يقوى
على الكل من اسمين واذا نقص منه جعل الذى يقوى على الباقى منفصلا
متى كان يحيط به خطان فى القوة مشتركان ومنطق اذا تركب مع موسط
جعل الذى يقوى على الكل من موسطين الاول واذا نقص من موسط
جعل الذى يقوى على الباقى منفصل موسط[276] الاول متى كان يحيط به
خطان فى القوة مشتركان وموسط اذا تركب معه موسط جعل الذى يقوى
على الكل من موسطين الثانى واذا نقص من موسط جعل الذى يقوى
على الباقى منفصل موسط الثانى متى كان الخطان اللذان يحيطان به فى
القوة مشتركين[277] وايضا اذا تركب موسط مع منطق جعل الذى يقوى
على الكل الاعظم واذا نقص من منطق جعل الذى يقوى على الباقى
الاصغر متى كان الخطان اللذان يحيطان به ويقويان على منطق فى القوة
متباينين واذا تركب منطق مع موسط جعل الذى يقوى على الكل[278]
Pag. 44 | القوى على منطق وموسط واذا نقص من موسط جعل الذى يقوى على
الباقى الذى يجعل الكل مع منطق موسطا متى كان الخطان اللذان
يحيطان به ويقويان على موسط فى القوة متباينين واذا ركب موسط مع
موسط جعل الخط القوى على الكل الذى يقوى على موسطين واذا نقص

موسط من موسط جعل الخط القوى على الباقى الذى يجعل الكل مع موسط موسطا متى كان الخطان اللذان يحيطان بالاصغر نفسه ويقويان على الاعظم فى القوة متباينين فاخذ المواضع اذًا يكون على ثلثة جهات موسط مضاف الى منطق او منطق مضاف الى موسط او موسط مضاف الى موسط وذلك ان اخذ منطق مضاف الى منطق ليس يوجد كما تبين وحدوث الخطوط التى تحيط بها يكون على جهتين اما فى القوة مشتركة واما فى القوة متباينة لانه ليس يمكن ان تكون مشتركة فى الطول[279] واصناف اخذها ايضا صنفان اما بالتركيب واما بالتفصيل

§ 16 فالخطوط الصم اذًا اثنى عشر يخالف بعضها بعضا اما بجهة اخذ المواضع فاذا ركبنا مرة موسطا[280] مع منطق وفصلنا مرة موسطا[281] من منطق واما بحسب الخطوط التى[282] تحيط بالاصاغر[282] فتقوى[283] على العظمى مثال ذلك اذا كانت فى القوة مشتركة واذا كانت فى القوة متباينة واما بحسب اختلاف المواضع مثال ذلك اذا نقصنا مرة منطقا من موسط ومرة موسطا من منطق ومرة يكون المركب مع الموسط منطقا ويكون الاصغر ومرة يكون المركب مع المنطق موسطا ويكون الاصغر لجميع الخطوط التى بالتركيب يخالف التى بالتفصيل بجهة الاخذ فاما بحسب الخطوط التى تحيط بالمواضع فقد يخالف الثلثة المتقدمة ومن التى بالتركيب والتى بالتفصيل للتالية واما بحسب اختلاف المواضع فان| الصم المنتظمة Pag. 45
فى ثلثة ثلثة منها يخالف بعضها بعضا فهذه حال قسمة الصم وترتيبها على راى اقليدس

§ 17 ولان القوم الذين اقتصوا هذه الاشياء زعموا ان ثااطيطس الاثينى اخذ

خطين فى القوة مشتركين فبرهن انه اذا اخذ فيما بينهما خط على نسبة فى التنـاسب الهندسى حدث الخط الذى يسمى الموسط واذا اخذ فى التناسب التاليفى حدث المنفصل فنحن نقبل هذه الاشياء اذ كان ثااطيطس يقولها ونضيف اليها ان التوسط الهندسى هو الخط الموسط بين خطين منطقين فى القوة مشتركين والتوسط العددى هو كل واحد من الخطوط التى بالتركيب[284] والتوسط التاليفى هو كل واحد من الخطوط التى بالتفصيل وان اصناف التناسب الثلثة تحدث جميع الخطوط الصم وقد برهن اقليدس برهانا واضحا انه متى كان خطان منطقين فى القوة مشتركين واخذ خط[285]



فيما بينهما متناسب لهما مناسبة هندسية فان الخط الماخوذ اصم ويسمى الموسط فاما الصم الباقية فسنبين فيهـا التنـاسب الباقى فلنضع خطين مستقيمين وهما خطا ا ب وخط ما موسط فيمـا بينهما على التنـاسب العددى وهو ج فخطا ا ب اذًا اذا تركبا كانا ضعف خط ج لان هذه خاصة التناسب العددى فان كان خطا ا ب منطقين فى القوة مشتركين فخط ج من اسمين لانهما اذا تركبا صارا ضعف ج ولكنهما اذا ركبا احدثا الذى من اسمين فلان[286] خط ج نصفهما فهذا[287] الخط من اسمين ايضا واذا كان خطا ا ب موسطين فى القوة مشتركين يحيطان بمنطق فان المركب منهما وهو ضعف خط ج يصير من موسطين الاول

فخط ج اذًا حاله هذه الحال لانه نصف المركب من الطرفين فان | كانا Pag. 46
موسطين فى القوة مشتركين يحيطان بموسط فان المركب منهما يصير من موسطين الثانى ومشاركا لخط ج لانه ضعفه فخط ج اذًا من موسطين الثانى ايضا وان كان خطا ا ب فى القوة متباينين وكان الذى من مربعيهما منطقا والذى بينهما اصم فان خط ج يصير الاعظم لان المركب من خطى ا ب هو الاعظم وهو ضعف خط ج فخط ج اذًا الاعظم وان كان الامر بالعكس اعنى ان كان خطا ا ب فى القوة متباينين وكان الذى من مربعيهما موسطا والذى بينهما منطقا صار خط ج القوى على منطق وموسط لانه مشارك للمركب من خطى ا ب وقد كان المركب منهما القوى على منطق وموسط وان كان خطا ا ب فى القوة متباينين وكان الذى من مربعيهما والذى بينهما موسطين فان خط ج يكون القوى على موسطين اذ كان المركب من خطى ا ب ضعف ج وهو القوى على موسطين فخط ج قوى على موسطين فخط ج اذًا لما كان توسطا عدديا احدث جميع الخطوط الصم التى بالتركيب

§ 18 وليكن المقدمات على هذه الصفة الاولى[288] اذا اخذ خط موسط فيما بين خطين منطقين فى القوة مشتركين على التناسب العددى فان الخط الماخوذ يكون من اسمين والثانية اذا اخذ خط متوسط بين خطين موسطين فى القوة مشتركين وكان الموضع الذى يحيطان به منطقا[289] على التناسب العددى فان الخط الماخوذ يصير من موسطين الاول والثالثة اذا اخذ خط متوسط بين خطين متوسطين فى القوة مشتركين يحيطان بموسط على التناسب العددى صار الخط الماخوذ من موسطين الثانى والرابعة[290] اذا

اخذ خط موسط بين خطين مستقيمين فى القوة متباينين فى التناسب العددى الذى من مربعيهما منطق والذى فيما بينهما موسط صار الخط الماخوذ اصم [291] ويسمى الاعظم والخامسة اذا اخذ خط متوسط من خطين
مستقيمين فى القوة متباينين الذى من مربعيهما موسط والذى بينهما Pag. 47
منطق على التناسب العددى صار الخط الماخوذ الذى يقوى على منطق وموسط والسادسة اذا اخذ خط متوسط بين خطين مستقيمين فى القوة متباينين الذى من مربعيهما موسط والذى يحيطان به موسط على التناسب العددى صار الخط الماخوذ الذى يقوى على موسطين والبرهان العام لجميعها هو ان الطرفين اذا تركبا صارا ضعف الاوسط وهما يحدثان الصم المطلوبة فهذه اذاً تكون مشاركة [292] للصم التى تحت نوع واحد

§ 19 وينبغى ان ننظر بعد هذه فى الخطوط الصم التى بالتفصيل كيف تظهر بالتوسط التاليفى ونقدم قبل ذلك ان خاصة التناسب التاليفى [293] انه يجعل الذى يحيط به كل واحد من الطرفين مع المتوسط ضعف الذى يحيط به الطرفان ومع هذا ايضا انه اذا كان خطان مستقيمان [294] يحيطان بموضع منطق او موسط وكان احدهما واحدا [295] من الخطوط الصم التى بالتركيب فان الاخر واحد من الخطوط التى بالتفصيل وهو الذى على مقابلته مثال ذلك انه ان كان احد الخطين المحيطين بالموضع من اسمين فان الباقى المنفصل وان كان من موسطين الاول فان الاخر منفصل موسط الاول وان كان من موسطين الثانى فان الاخر منفصل موسط الثانى وان كان الاعظم فان الاخر الاصغر وان كان القوى على منطق وموسط فالاخر الذى يجعل الكل موسطا مع منطق وان كان القوى على موسطين فان

الاخر الذى يجعل الكل مع موسط موسطا فاذ قد قدمنا واخذنا هذه الاشياء فلنضع خطين وهما خطا اب بج والمتوسط بينهما فى النسبة على التناسب التاليفى[296] خط بد[297] فان كان خطّا اب بج منطقين فى القوة مشتركين[297] فان الذى بينهما موسط فان الذى بينهما مرتين | موسط Pag. 48

لكن الذى بينهما مرتين مساو للسوضع[298] الذى يحيط به خطا اب بد وللذى يحيط به خطا بج بد فالذى يحيط به اذاً اب بد بج بد موسط ايضا لكن الذى يحيط بكل واحد من اب بج مع بد مساو للذى يحيط به جميع خط اج وخط بد فالذى يحيط به اذاً خطا اج بد موسط ويحيط به خطان مستقيمان احدهما وهو خط اج من اسمين فخط بد اذاً المنفصل وان كان خطا اب بج موسطين فى القوة مشتركين يحيطان بمنطق فانا اذا عملنا ذلك العمل بعينه كان الذى يحيط به خطا اج بد منطقا وكان خط اج من الموسطين الاول فخط بد اذاً منفصل الموسط الاول وان كان خطا اب بج موسطين فى القوة مشتركين يحيطان بموسط يكون لتلك الاسباب باعيانها الذى يحيط به اج بد موسطا[299] وخط اج من موسطين الثانى فخط بد اذاً منفصل موسط الثانى وان كان خطا اب بج فى القوة متباينين والذى من مربعيها منطق والذى يحيطان به موسط فان الذى يحيطان به مرتين يصير موسطا فالذى يحيط به اذاً اج بد موسط وخط اج

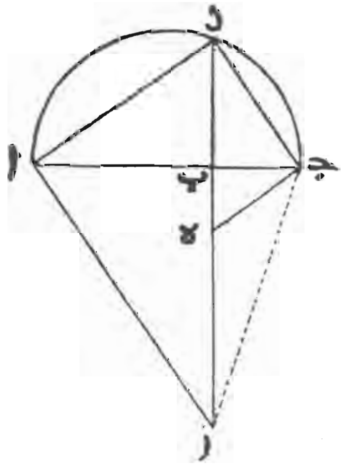
الاعظم فخط بد الاصغر وان كان خطا اب بج فى القوة متباينين والذى من مربعيهما موسط والذى يحيطان به منطق فان الذى يحيط به خطا اج بد يصير منطقا وخط اج يقوى على منطق وموسط فخط بد اذاً الذى يجعل الكل مع منطق موسطا وان كان خطا اب بج فى القوة متباينين والمركب من مربعيهما موسط والذى يحيطان به موسط ايضا صار الذى يحيط به خطا اج بد موسطا وخط اج يقوى على موسطين فخط بد اذاً الذى يجعل الكل مع موسط موسطا فالمتوسط اذاً العددى اذا اخذ من الخطوط المركبة احدث واحدا من الخطوط الصم التى بالتركيب والتوسط التاليفى واحدا من الخطوط التى بالتفصيل وهو المقابل للمركب من الخطوط المفروضة

§ 20 وليكن مقدمات هذه ايضا بهذه الصفة الاولى اذا اخذ توسط تاليفى من

Pag. 49 الخطين اللذين منهما كان الذى من اسمين فان الخط الماخوذ هو المنفصل والثانية اذا اخذ توسط تاليفى بين الخطين اللذين يكون منهما من الموسطين الاول فان الماخوذ هو منفصل موسط الاول والثالثة اذا اخذ توسط تاليفى بين الخطين اللذين منهما يكون الذى من موسطين الثانى فان الماخوذ منفصل موسط الثانى والرابعة اذا اخذ موسط تاليفى بين الخطين اللذين يكون منهما الاعظم فان الماخوذ هو الاصغر والخامسة اذا اخذ توسط تاليفى بين الخطين اللذين يكون منهما القوى على منطق وموسط صار الماخوذ هو الذى يجعل الكل مع منطق موسطا والسادسة اذا اخذ توسط تاليفى بين الخطين اللذين يكون منهما القوى على موسطين فان الماخوذ يصير الذى يجعل الكل مع موسط موسطا فالتوسط اذاً الهندسى تبين لنا اول الخطوط[300] الصم وهو الموسط والتوسط العددى تبين لنا

جميع الخطوط[300] التى بالتركيب والتوسط التاليفى تبين لنا جميع الخطوط التى بالتفصيل ويُبَيّن[301] لنا مع ذلك من هذه الاشياء ان قول ثااطيطس حق فان التوسط الهندسى بين خطين منطقين فى القوة مشتركين هو الخط الموسط والتوسط العددى بينهما هو الخط الذى من اسمين والتوسط التاليفى بينهما هو المنفصل فهذا مبلغ ماكان عندنا فى الخطوط الصم الثلثة عشر من تثبتنا لقسمتها وترتيبها ومجانستها لاصناف التناسب الثلثة التى تمدحها القدماء

§ 21 واما الامر فانه[302] اذا كان احد الخطين يحيطان بمنطق او موسط واحدا[303] من الخطوط الصم التى بالتركيب فان الخط الباقى يكون الخط المقابل له من الخطوط التى بالتفصيل فينبغى ان نبينه على هذا الوجه بعد



Pag. 50 ان نقدم قبله هذا الشكل ليكن خطا اب بج يحيطان بمنطق وليكن اب اعظم من بج وليكن على خط اج نصف دائرة وهى ادج ولنخرج خط بد على زوايا قائمة فخط بد منطق ايضا لانه قد تبين انه متوسط فى النسبة بين خطى اب بج واذا[304] وصلنا بين دا و دج بخطين مستقيمين وذلك

ان زاوية د قائمة لانها فى نصف دائرة ولنخرج على خط دا خط از على
زوايا قائمة ولنخرج خط دب وليلق خط از[305] على نقطة ز ولنخرج
خطا من دج على زوايا قائمة اقول انه لا يلقى خط دز على نقطة ز ولا يمر
خارجا من از بل قد يقع داخله فان امكن فليلقه على ز فسطح دازج
اذًا متوازى الاضلاع لان زواياه كلها قائمة وخط دا اكبر من خط دج
فخط جز اذًا اعظم من خط از لان الخطين المتقابلين متساويان فمربعا[306]
جب بز اذًا اعظم من مربعى اب بز فخط بج اذًا اكبر من خط با هذا
خلف لانه قد كان اصغر منه ومن الاجود ان نبينه على هذا الوجه لان
الزاويتين اللتين عند نقطتى ا ج قائمتان وخطى اب بج عمودان فان
القائم الزوايا الذى من دب بز مساو لمربع بج وهو بعينه مساو لمربع اب
فمربع اب اذًا مساو لمربع جب وقد وصفنا ان خط اب اعظم من خط
بج وعلى ذلك المثال نبين انه لا يلقاه خارجا عن نقطة ز فليلقه اذًا داخلها
على نقطة ه فاقول ايضا ان القائم الزوايا الذى من زب به مساو لمربع دب
وهو منطق لان مثلث دجه قائم الزاوية وخط جب عمود فان المثلثين
متشابهان فزاوية ه اذًا مساوية لزاوية دجب[307] وهذا بعينه زاوية
دجب[308] مساوية لزاوية بدا[309] وهذا بعينه ايضا زاوية بدا[310] مساوية
لزاوية | باز لان زاوية ج وزاوية د وزاوية ا جميعا قائمة فزاوية ه اذًا Pag. 51
مساوية لزاوية باز ولكن[311] الزاويتين اللتين عند ب قائمتان فزاوية بجه
الباقية اذًا مساوية لزاوية ز فمثلث بجه اذًا مساوية زواياه لزوايا مثلث
باز فنسبة خط بز اذًا الى خط با كنسبة خط بج الى خط به لانها توتر
زوايا متساوية فالقائم الزوايا الذى يحيط[312] به زب به مساو للقائم الزوايا

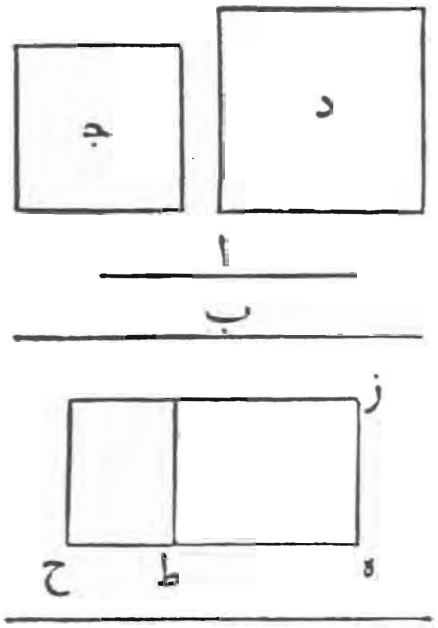
الذى يحيط به اب بج لكن القائم الزوايا الذى يحيط به اب[313] بج مساو لمربع دب فالقائم الزوايا اذاً الذى يحيط به زب به منطق

§ 22 واذ قد تقدمنا وبينا هذه الاشياء فنحن مبينون الاشياء التى قصدنا قصدها فليكن خطا اب بج يحيطان بمنطق وقد بين اوقليدس انه اذا اضيف منطق[314] الى الذى من اسمين فان عرضه يكون منفصلا ومرتبته مرتبته فان كان خط اب من اسمين فخط بج منفصل فان كان ذلك الذى من اسمين الاول فهذا المنفصل الاول فان كان ذلك الذى من اسمين الثانى فهذا المنفصل الثانى وان كان الثالث فهو الثالث وعلى هذا المثال يجرى الامر فى الباقية وليكن ايضا خط اب من موسطين الاول فانا اذا عملنا ذلك العمل تبين ان[315] [خط بج منفصل موسط الاول فان[315]] خط بز الذى من اسمين الثانى لان ما يكون من الذى من موسطين الاول اذا اضيف الى منطق فان عرضه يكون الذى من اسمين الثانى ولان القائم الزوايا الذى يحيط به زب به منطق يكون خط به المنفصل الثانى وذلك ان منطقا اذا اضيف الى الذى من اسمين الثانى كان عرضه منفصل[316] الثانى فخط بج اذاً منفصل موسط الاول وذلك انه اذا كان موضع يحيط به منطق ومنفصل الثانى فان القوى على ذلك الموضع منفصل موسط الاول وايضا فليكن خط اب من موسطين الثانى وليحط مع خط بج بمنطق اقول ان خط بج | منفصل موسط الثانى لانا اذا عملنا ذلك العمل بعينه فلان خط Pag. 52 اب من موسطين الثانى وخط دب منطق فخط بز من اسمين الثالث وذلك ان ما يكون من[317] موسطين الثانى اذا اضيف الى منطق كان عرضه الذى من اسمين الثالث ولان القائم الزوايا الذى يحيط به زب به منطق

يكون خط به المنفصل الثالث لانه اذا كان خطان يحيطان بمنطق وكان احدهما من اسمين فان الباقى يكون المنفصل ومرتبته مرتبته وخط بز الذى من اسمين الثالث فبه اذاً منفصل الثالث وخط بد منطق وما كان يحيط به منطق والمنفصل الثالث فان الذى يقوى عليه(318) منفصل الموسط الثانى فخط بج اذاً منفصل الموسط الثانى لان القائم الزوايا الذى يحيط به هب بد مساو للمربع الذى من خط بج وذلك ان الزاوية التى عند ج قائمة وليكن خط اب الاعظم اقول ان خط بج الاصغر لانا اذا عملنا ذلك العمل بعينه فلان خط اب الاعظم وخط بد منطق فخط بز من اسمين الرابع لان ما يكون من الاعظم اذا اضيف الى منطق فان عرضه يكون الذى من اسمين الرابع لكن القائم الزوايا الذى يحيط به زبه منطق فخط به اذاً منفصل الرابع وذلك ان مرتبة خط بز هى مرتبة خط به بعينها لان القائم الزوايا الذى منهما منطق فلان خط بد منطق وخط به منفصل الرابع يكون خط بج الاصغر لان القائم الزوايا الذى يحيط به منطق ومنفصل الرابع فان القوى عليه هو الاصغر وايضا فليكن خط اب القوى على منطق وموسط اقول ان خط بج هو الذى يصير الكل مع منطق موسطا لانا اذا عملنا ذلك العمل بعينه فلان خط اب هو القوى على منطق وموسط وخط بد منطق فخط بز من اسمين الخامس لان الذى يكون من القوى على منطق وموسط اذا اضيف الى منطق يكون عرضه الذى من اسمين الخامس ولان | القائم الزوايا الذى يحيط به زبه منطق فخط به المنفصل Pag. 53
الخامس فلان خط بد منطق فخط بج الذى يصير الكل مع منطق موسطا لان الخط الذى يقوى على موضع مساو للموضع الذى يحيط به منطق والمنفصل

الخامس هو هذا الخط وايضا فليكن خط اب القوى على موسطين اقول
ان خط بجـ الذى يصير الكل مع موسط موسطا لانا اذا عملنا ذلك العمل
بعينه فلان خط بد منطق وخط اب القوى على موسطين فخط بز من
اسمين السادس والقائم الزوايا الذى يحيط به زبه منطق فخط به اذاً المنفصل
السادس وخط بد منطق فمربع بجـ اذاً يقوى عليه الخط الذى يصير الكل
مع موسط موسطا فخط بجـ اذاً الذى يجعل الكل مع موسط موسطا فاذا
كان اذاً موضع منطق يحيط به خطان مستقيمان[319] احدهما اصم من
الخطوط التى بالتركيب فان الباقى يكون المقابل له من[320] التى بالتفصيل[321]
ولكن هذا امر بين مما وصفنا

§ 23 فاما انه اذا كان خطان يحيطان بموسط وكان احدهما واحدا من



[321] الخطوط الصم التى بالتركيب فان الباقى يكون المقابل له من التى بالتفصيل

فهو بين من هذه الاشياء ولنقدم انه اذا كان خطان مستقيمان نسبة احدهما الى الاخر كنسبة موضع منطق الى موضع موسط او كنسبة موسط الى موسط وكانت المواضع متباينة فان الخطين فى القوة مشتركان[322] فلنضع ان نسبة خط ا (*) الى خط ب كنسبة موضع ج الى موضع د كان احدهما منطقا والاخر موسطا او كانا كلاهما موسطين الا انهما متباينان ولنضع خط هز منطقا ونضيف اليه موضعا مساويا لموضع ج وهو زط ونضيف اليه ايضا موضعا مساويا لموضع د وهو زح فخطا طه هح اذاً منطقان فى القوة مشتركان[323] كان الموضعان المضافان الى الخط المنطق منطقا وموسطا او موسطين بعد ان يكونا متباينين فلان نسبة خط طه الى خط حه كنسبة موضع زط الى موضع زح اعنى كنسبة موضع ج الى موضع د ونسبة موضع ج الى موضع د كنسبة خط ا الى خط ب فنسبة خط طه اذاً الى خط هح كنسبة خط ا الى خط ب وخطا طه هح فى القوة مشتركان فخط ا اذاً فى القوة مشارك لخط ب فاذ قد تبين ذلك، فلناخذ فى برهان ما قصدنا له اذا كان خطان[324] مستقيمان يحيطان بموسط وكان احدهما من الخطوط الصم التى بالتركيب فان الباقى يكون المقابل له من الخطوط التى بالتفصيل فليكن خطا اب جد وليكن الموضع الذى يحيطان به موسطا واحدهما وهو خط اب واحد من الخطوط التى بالتركيب، اقول ان خط جد الاخر وهو[325] واحد من الخطوط التى بالتفصيل وهو المقابل له فلنضف الى خط اب موضعا منطقا وهو الذى يحيط به ابح فخط بح اذاً لما تقدم من البيان واحد من الخطوط الصم[326] التى بالتفصيل وهو المقابل لخط اب وذلك ان الذى يحيطان به منطق فلان الموضع الذى يحيط به خطا

Pag. 54

اب جد موسط والذى يحيط به ابح منطق فنسبة خط حب الى جد[327]
كنسبة موضع منطق الى موضع موسط واذا كان هذا هكذا فهما فى القوة
مشتركان كما قد تبين واذا كان هذا هكذا ايضا فمن اى الخطوط الصم التى
بالتفصيل كان خط جد[328] نظير الخط اب فان خط بح[329] مثله بعينه
وذلك ان الموضعين اللذين يقويان عليهما مشتركان[330] فمتى كان اذاً خطان
مستقيمان يحيطان اما بمنطق واما بموسط فانه اذا كان احدهما واحدا
من الخطوط التى بالتركيب فان الاخر الخط الذى هو نظيره من التى
بالتفصيل فاذ قد تبينت هذه الاشياء فظاهر ان بالتناسب التاليفى يظهر
جميع الخطوط الصم[331] التى بالتفصيل من الخطوط[331] التى | بالتركيب على Pag. 55
الجهة التى تقدم وصفها وليس شىء مما اخذناه غير مبرهن

§ 24 ونتبع ما قلناه صفة ما يجىء[332] من اختلاف الخطوط التى من اسمين
والمنفصلة المقابلة لها[333] وذلك انه جعل الذى من اسمين بستة اصناف
وكذلك المنفصل والحال التى بها جعل كل واحد منها ستة بين وذلك انه
اخذ القسم الأعظم والاصغر من الذى من اسمين وميز قواها لانه واجب
ضرورة ان يكون الخط الاعظم اعظم قوة من الاصغر اما بما يكون من مشارك
له واما بما يكون من مباين له فان كان اعظم قوة[334] منه بما يكون من
مشارك له فاما ان يكون هو مشاركا[335] للمفروض منطقا واما ان يكون
الاصغر واما ألّا يكون واحد منهما لانه ليس يمكن ان يكونا كلاهما مشاركين
له وذلك انه يكونا عند ذلك مشتركين وهذا ممتنع فيهما وان كان الاعظم
اعظم قوة من الاصغر بما يكون من مباين له لزم مثل ذلك ايضا اما ان
يكون هو مشاركا[336] للمفروض منطقا واما ان يكون الاصغر واما ألّا يكون

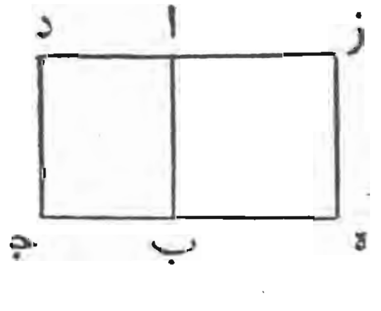
واحد منهما لانه لا يمكن ان يكونا كلاهما[337] مشاركين له لذلك السبب بعينه فيصير اذًا ثلثة خطوط من اسمين ان كان الخط الاعظم اعظم قوة من الاصغر بما يكون من مشارك له وثلثة ان كان اعظم قوة منه بما يكون من مباين له وايضا لانا قلنا ان المنفصل يكون اذا كانت نسبة الخط باسره الى احد جزءية نسبة الخط الذى من اسمين اذا كان القسم الاخر من اقسام الخط باسره هو المنفصل وكان واجب ضرورة ان يكون الخط باسره اعظم قوة من جزئه الاخر اما بما يكون من مشارك له واما بما يكون من مباين له وفى كل واحد من هذين اما ان يكون الخط باسره مشاركا للمفروض منطقا واما ان يكون جزؤه الذى نسبته اليه هى نسبة الذى من اسمين واما
ألّا يكون | واحد منهما مشاركا[338] له لانه ليس يمكن ان يكونا كلاهما مشاركين Pag. 56
له كالحال فى الذى من اسمين وجب ضرورة ان يكون المنفصل ستة اصناف وان يسمى المنفصل الاول والثانى والثالث الى المنفصل السادس

§ 25 فمن اجل ما ذكر هذه الستة الخطوط المنفصلة والستة التى من اسمين الا ليبين من الراس الخواص المختلفة للخطوط الصم التى بالتركيب والتى بالتفصيل وذلك انه يستخرج تبديلها على ضربين اما على حسب معنى كونها واما على حسب عروض المواضع التى تقوى عليها من ذلك ان الذى من اسمين يخالف الذى من موسطين الاول فى الكون نفسه لان الاول من منطقين فى القوة مشتركين والثانى من موسطين فى القوة مشتركين يحيطان بمنطق ويختلفان ايضا فى العرض الذى يحدث من اضافة الموضعين اللذين منهما الى المنطق وذلك ان ذاك جعل عرضه الذى من اسمين الاول وهذا يجعله الثانى كما ان الذى من موسطين الثانى يجعل عرضه الذى من اسمين

الثالث والاعظم يجعل عرضه الذى من اسمين الرابع والقوى على منطق وموسط يجعله الخامس والقوى على موسطين يجعله السادس وذلك ان عدة الخطوط التى من اسمين بعدة الخطوط الصم التى بالتركيب لان كل واحد من الفريقين ستة ويصير[339] الخطوط التى من اسمين ستة عروضا عن اضافة مواضع تيك الى خط منطق بحسب مراتبها الاول من الاول والثانى من الثانى وما يتلوا ذلك على هذا المثال حتى يكون الذى من اسمين السادس عرض الموضع الذى من القوى على موسطين المضاف الى منطق وعلى مثل ذلك بعينه اضاف الخطوط المنفصلة الستة ليبين بها اختلاف الصم التى بالتفصيل وليس انما يختلف فى كونها فقط فان المنفصل ليس انما يخالف منفصل الموسط الاول فقط فى انه هو حدث عن انفصال خط | نسبته الى Pag. 57 الخط الذى انفصل منه باسره نسبة الذى من اسمين وذاك حدوثه بانفصال خط نسبته الى الخط الذى انفصل منه باسره نسبة الذى من موسطين الاول لكن قد يخالفه ايضا فى ان[340] الذى من المنفصل اذا اضيف الى منطق يكون عرضه المنفصل الاول والذى من منفصل الموسط الاول يكون عرضه المنفصل الثانى وكذلك الحال فى الباقية وذلك ان عدة الخطوط المنفصلة كعدة الخطوط الصم التى بالتفصيل وقوى هذه اذا اضيفت[341] الى منطق تكون عروضها الستة الخطوط المنفصلة على مراتبها فالقوة التى من الاول يكون عرضها المنفصل الاول والتى من الثانى يكون الثانى والتى من الثالث يكون الثالث والتى من الرابع يكون الرابع والتى من الخامس يكون الخامس والتى من السادس يكون السادس وذلك ان هذا مبلغ كل واحد من الصنفين اعنى الخطوط المنفصلة والخطوط الصم التى بالتفصيل وهى نظائر

فى المرتبة الاوائل عند الاوائل والمتوسطة عند المتوسطة والاواخر عند الاواخر

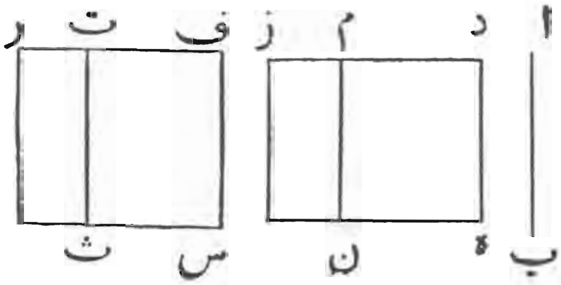
§ 26 وينبغى ان نكون ذاكرين لهذه الاشياء انه اذا اضيف الذى يكون من واحد من الخطوط الصم التى بالتركيب الى المنطق يكون عرضه واحدا[342] من التى من اسمين وايضا اذا اضيف الذى يكون من واحد من الخطوط التى بالتفصيل الى منطق يكون عرضه واحدا من الخطوط المنفصلة فاما ان لم يضف المربعات انفسها الى منطق لكن اضيفت[343] الى خط موسط فقد تبين ان العروض تكون اما فى التركيب فالتى من موسطين الاوائل والثوانى واما فى التى بالتفصيل فمنفصل الموسطات الاوائل والثوانى وواجب ضرورة ان ناخذ فى البرهان عليها انه اذا اضيف | منطق الى Pag. 58



موسط كان عرضه موسطا فليكن موضع اج منطقا[344] مضافا الى خط موسط وهو اب اقول ان خط اد موسط فلنرسم مربع اب فهو اذا موسط ونسبته الى موضع اج كنسبة موسط الى منطق فنسبة زا ايضا الى اد هذه النسبة فخطا[345] زا اد اذا فى القوة مشتركان والذى من زا موسط لان الذى من اب موسط فالذى من اد اذا موسط فخط اد اذا موسط

§ 27 واذ قد تقدمنا واخذنا هذا اقول انه اذا اضيف الذى[346] يكون من

الذى[346] من اسمين او الذى من الاعظم الى موسط يكون عرضه الذى من
موسطين الاول والذى من موسطين الثانى فليكن خط اب من اسمين



او[347] الاعظم وخط ده موسطا وموضع هز مساويا للذى من اب
ولنفرض خط فس منطقا وموضع سر مساويا للذى من اب فان
كان خط اب من اسمين فبين ان خط فر من اسمين الاول وان كان
اب اعظم ففر من اسمين الرابع فان هذا قد تبين فى اضافة المواضع
الموصوفة الى الخط المنطق فلنقسم فر الى الاسمين على نقطة ت ففى
كل واحد من اللذين من اسمين يكون خط فت مشاركا لخط فس
المفروض منطقا وموضع ست منطق وموضع رث موسط وذلك ان خطى
فس فت فى الطول مشتركان فخطا[348] ثت تر فى القوة مشتركان ومنطقان
فلنفصل موضع هم مساويا لموضع ست فموضع ثر اذًا الباقى مساويا
لموضع نز وذلك انه قد كان موضع هز مساويا لموضع رس فموضع نز اذا
Pag. 59 موسط وموضع هم منطق مضاف الى خط هد[349] الموسط فخط دم اذًا موسط
كما تبين انفا فربع ده اذًا اذ هو موسط لانه من خط هد[350] الموسط
رسم[351] اما ان يكون مشاركا لموضع نز او مباينا له وليكن اولا مشاركا له
ولكن نسبة الذى من هد[352] الى موضع نز[353] كنسبة خط هد[354] الى

خط مز لان ارتفاعهما جميعا واحد بعينه فخط هد [355] اذًا فى الطول مشارك
لخط مز فخط مز اذًا موسط فخطا دم مز موسطان اقول ان الموضع الذى
يحيطان به منطق ايضا ولان خط هد مشارك لخط مز ونسبة خط هد
الى خط مز كنسبة القائم الزوايا الذى يحيط به ده دم الى الذى يحيط
به دم مز ان انت وضعت خطى هد مز متصلين على استقامة وصيرت
خط دم الارتفاع فوضع هم اذًا مشارك للذى يحيط به دم مز وموضع
هم منطق فالذى يحيط به اذًا دم مز منطق ايضا فخط دز اذًا من
موسطين الاول وليكن مربع هد غير مشارك لموضع تز فنسبة خط هد اذًا
الى خط مز هى نسبة موضع موسط الى موضع موسط مباين له وقد تبين
هذا اذا نحن رسمنا الذى من هد لان [356] المرسوم وموضع [356] تز تحت
ارتفاع واحد بعينه فقاعدتاهما اذًا فى نسبة واحدة بعينها اعنى خط
مز [357] وخط هد لان هذا الخط مساو لقاعدة الموضع الذى منه فخط هد
اذًا فى القوة مشارك لخط مز وقد كان تبين هذا انفا فالذى من مز
اذًا موسط فخط مز اذًا نفسه موسط [358] فخطا دم مز اذًا موسطان اقول ان
الذى يحيطان به موسط وذلك انه لما كان موضع هم منطقا [359] وموضع تز
موسطا [360] فنسبة خط دم الى خط مز كنسبة موضع منطق الى موضع موسط
فخطا دم مز اذًا مشتركان فى القوة فان هذا قد تبين فيما تقدم فلان خط
هد فى الطول مباين لخط مز وموضع هم مباين للذى يحيط به دم مز
| وموضع هم منطق فالذى يحيط به اذًا دم مز ليس بمنطق وخطا دم مز Pag. 60
موسطان فى القوة مشتركان والقائم الزوايا الذى يحيط به خطان موسطان
فى القوة مشتركان اما ان يكون منطقا او موسطا كما بين اوقليدس

فالذى يحيط به اذًا خطا دم مز اذ ليس هو منطقا فهو اذًا موسط فخط دز اذًا من موسطين الثانى فاذا اضيف اذًا مربع الذى من اسمين او مربع الاعظم الى موسط يكون عرضه الذى من موسطين الاول والذى من موسطين الثانى

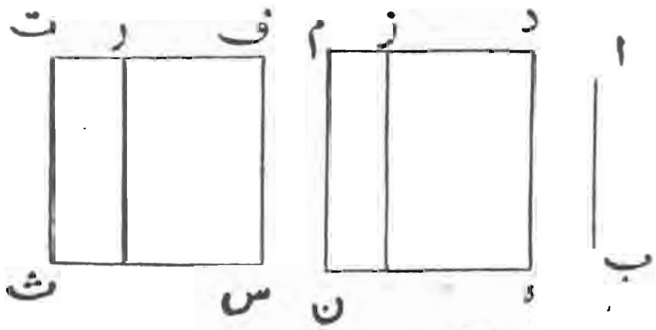
§ 28 وايضا فليكن خط اب اما الذى من موسطين الاول واما القوى على منطق وموسط وخط ده موسطا وليضف[361] الى خط ده موضع مساو لمربع خط با وليكن خط فس منطقا وموضع سر مساويا لمربع[362] اب فخط فر اذًا من اسمين اما الثانى ان كان خط اب من موسطين الاول واما الخامس ان كان خط اب القوى على منطق وموسط وليقسم على اسميه بنقطة ت[363] فخط تر[364] على كل واحدة من جهات اللذين من اسمين مشارك للخط المفروض منطقا وموضع ثر[365] منطق وموضع ست موسط ولنفصل موضع هم مساويا لموضع ست فموضع نز[366] اذًا الباقى مساو لموضع ثر[367] فموضع هم موسط وموضع نز منطق وقد اضيف الى موسط وهو خط هد فخط مز اذًا موسط فلان موضع هم موسط وقد اضيف الى خط موسط وهو خط هد فالذى من هد[368] اما ان يكون مشاركا لموضع هم واما مباينا له وليكن اولا مشاركا له فخط هد[369] مشارك لخط دم فخط دم اذًا موسط ايضا ولان خط مز مشارك لخط هد فى القوة وخط هد مشارك فى الطول لخط مد فخط[370] مز فى القوة مشارك لخط مد فلان خط هد مشارك فى الطول لخط دم ونسبة خط هد الى خط مد كنسبة الذى يحيط به خطا هد[371] مز الى الذى يحيط به دم مز
Pag. 61 | فهذان ايضا مشتركان والذى يحيط به هد مز منطق لانه موضع نز والذى يحيط به اذًا مد مز منطق فخط دز اذًا من موسطين الاول وليكن مربع

هد مباينا لموضع هم فنسبة اذن خط هد الى خط مد النسبة التى لموسط الى موسط مباين له فخطا هد دم فى القوة مشتركان ومربع دم موسط فخط دم اذًا موسط وعلى مثال ما تقدم بعينه تبين ان خط دز من موسطين الثانى فاذ اضيف اذًا مربع الذى من موسطين الاول او القوى على منطق وموسط الى موسط يكون عرضه الذى من موسطين الاول والذى من موسطين الثانى

§ 29 وايضا فليكن خط اب[372] الخطين الباقيين من التى بالتركيب اعنى الذى من موسطين الثانى والقوى على موسطين وليكن خط هد موسطا وخط فس منطقا وليكن تلك الاشياء بعينها فخط فر اذًا من اسمين اما الثالث واما السادس لان هذين هما اللذان بقيا وليس واحد منهما مشاركا فى الطول لخط فس وموضعا ست تر موسطان متباينان فموضعا هم نز ايضا موسطان ولان خط هد[373] موسط وخطا مد مز موسطان فبين ايضا ان احدهما مشارك لخط هد ولان[374] احد موضعى هم نز[375] مشارك لمربع هد والذى يحيط به اذًا دمز مشارك لاحدهما فالذى يحيط به دمز اذًا موسط[376] فخط دز اذًا من موسطين الثانى[376] واذ كان مربع هد غير مشارك لواحد منهما فلين واحد من دم مز مشاركا فى الطول[377] لخط هد فليس الذى يحيط به دمز اذًا مشاركا لكل واحد منهما وخطا مد مز[378] موسطان فى القوة مشتركان والذى منهما[379] اذًا اما ان يكون منطقا او موسطا فاذا اضيف اذًا مربع الذى من موسطين الثانى والقوى على موسطين الى خط موسط يكون العرض اما الذى من موسطين الاول واما | الذى من موسطين الثانى وهذا شىء قد تبين فى الخطوط الصم الباقية Pag. 62

فربع اذًا كل خط من الخطوط التى بالتركيب اذا اضيف الى خط موسط
يكون عرضه الذى من موسطين الاول والذى من موسطين الثانى

ولناخذ بعد هذه الخطوط الصم التى بالتفصيل اثنين اثنين وليكن خط § 30
اب ايضا اما المنفصل واما الاصغر وليكن خط هد موسطا ولنضف اليه



موضع هز مساويا لمربع اب اقول ان خط دز اما ان يكون منفصل الموسط
الاول واما ان يكون منفصل الموسط الثانى وليكن خط فس منطقا
ونضيف اليه موضع سر مساويا لمربع خط اب فخط فر اذاً اما المنفصل
الاول[380] واما المنفصل الرابع ان كان خط اب الاصغر وليكن خط رت لفق
خط فر[381] وموضع زن مساويا لموضع ثر فنسبة موضع سر الى موضع ثر
كنسبة موضع هز الى موضع نز فنسبة خط فر اذًا الى خط تر كنسبة
خط دز الى خط مز ولكن[382] موضع ست منطق وذلك انه على المنفصل
الاول وعلى الرابع فخط فت مشارك للمفروض منطقا وهو خط فس والذى
يحيطان به اذ هما فى الطول مشتركان منطق وموضع هم منطق لانه مشارك
لموضع ست ولان موضع هم منطق مضاف الى هد الموسط فخط مد موسط
ولان خطى[383] سف رت منطقان فى القوة مشتركان وذلك ان خط[384] فر
اما | المنفصل الاول واما الرابع[384] فالذى يحيطان به وهو تر موسط فموضع Pag. 63

تز اذًا موسط لكن مربع هد ايضا موسط فهذان اذًا اما مشتركان واما متباينان وليكونا مشتركين فخط زم اذًا مشارك لخط هد كما بينا فى الاشياء التى تقدمت فخطا مد مز موسطان ولان هاهنا ثلثة خطوط وهى هد دم مز فنسبة خط هد الى خط مز كنسبة الذى يحيط به هد دم الى الذى يحيط به مد مز فهذان اذًا مشتركان وموضع هم منطق فالذى يحيط به دمز اذًا منطق فخط دز اذًا منفصل الموسط الاول وان كان مربع هد مباينا لموضع تز وليس خط مز فى الطول بمشارك لخط هد ولكن فى القوة لان نسبته اليه كنسبة مربع هد الموسط الى موسط مباين له وهو موضع تز فمربع مز اذًا موسط فهو اذًا موسط ايضا ولان خط مد فى القوة مشارك لخط هد وخط مز فى القوة مشارك له ايضا بعينه فهما ايضا فى القوة مشتركان فلان خط هد مباين لخط مز فى الطول ونسبة خط هد الى خط مز كنسبة موضع هم الى الذى يحيط به دمز فهذان[385] ايضا متباينان وموضع هم منطق فالذى يحيط به اذًا دمز غير منطق وخطا مد مز موسطان فى القوة مشتركان فالذى يحيطان[386] به اذًا موسط وذلك ان القائم الزوايا الذى يحيط به خطان موسطان[387] فى القوة مشتركان اما منطق واما موسط فخط دز اذا منفصل الموسط[388] الثانى فاذا اضيف اذًا مربع المنفصل او مربع الاصغر الى خط موسط يكون عرضه[389] منفصل الموسط[389] الاول او الثانى

§ 31 وليكن ايضا خط اب منفصل الموسط الاول او الذى يصير الكل مع منطق موسطا وليكن خط هد موسطا ولنضف الى خط هد موضعا مساويا لمربع اب اقول ان خط دز منفصل الموسط اما الاول واما الثانى وذلك ان

خط فس منطق وقد اضيف اليه موضع سر مساو لمربع اب فخط فر اذًا اما
المنفصل الثانى واما الخامس وليكن خط تر لفقا له ولنتمم موضع ست
Pag. 64 وليكن موضع زن مساويا لموضع ثر فلان خط فر المنفصل اما الثانى واما
الخامس فخط فت اذًا منطق فى القوة مشارك لخط فس المفروض منطقا
وخط تر فى الطول مشارك له فوضع ثر منطق وموضع ست موسط لان
ذاك يحيط به منطقان فى الطول مشتركان وهذا يحيط به خطان فى القوة
مشتركان وموضع نز اذًا منطق وموضع هم موسط فلان موضع نز منطق
مضاف الى خط هد الموسط فعرضه وهو خط مز موسط فى القوة مشارك
لخط هد لان المنطق انما يحيط به من الموسطات المشتركات فى القوة ولان
موضع هم ومربع ده موسطان فهما اما مشتركان او متباينان[390] فليكونا
مشتركين فخط ده اذًا مشارك فى الطول لخط دم فهو اذًا موسط ايضا
فلان خط زم فى القوة مشارك لخط ده فخطا دم مز فى القوة مشتركان فلان
نسبة خط ده الى خط دم كنسبة الذى يحيط به خطا ده زم الى الذى يحيط
به خطا زم مد ان انت جعلت قاعدتيهما خطى ده دم وارتفاعهما خط زم
فالذى[391] يحيط به خطا ده زم مشارك للذى يحيط به زم مد والذى يحيط
به ده زم منطق فالذى يحيط به زم مد اذًا منطق فخط زد اذًا منفصل
موسط الاول وان كان مربع ده مباينا لموضع هم فنسبة خط ده الى خط
دم كنسبة موسط الى موسط مباين له فهما اذًا فى القوة مشتركان فخط دم
اذًا موسط فخطا دم مز فى القوة مشتركان وذلك ان كل واحد منهما فى
القوة مشارك لخط هد فلان خط هد فى الطول مباين لخط دم ونسبة خط
هد الى خط دم كنسبة الذى يحيط به خطا ده زم الى الذى يحيط به

زم مد فهذان[392] ايضا متباينان وموضع زن منطق فليس الذى يحيط به دمز اذًا بمنطق[393] وخطا دم مز موسطان فى القوة مشتركان فالذى يحيطان[394] به اذًا موسط فخط دز اذًا منفصل الموسط الثانى فاذا اضيف اذًا مربع منفصل موسط الاول او مربع الذى يصير الكل مع منطق موسطا الى خط موسط يكون عرضه منفصل موسط الاول او الثانى

| وليكن ايضا خط اب واحدا[395] من الخطين الاصمين الباقين اما منفصل موسط الثانى واما الذى يصير الكل مع موسط موسطا وليكن خط ده موسطا[396] وموضع هز مساويا لمربع اب وخط فس منطقا وموضع سر مساويا[397] لمربع اب فخط فر اذًا المنفصل اما الثالث واما السادس من قبل ان خط اب اما ان يكون الثالث من الخطوط الصم التى بالتفصيل واما ان يكون السادس وليصير خط تر لفقه وموضع زن مساويا لموضع تر فلان خط فر اما ان يكون المنفصل الثالث او السادس فكل واحد من خطى فت تر مباين فى الطول لخط فس المفروض منطقا وهما منطقان فى القوة مشاركان لخط فس فكل واحد اذًا من موضعى ست تر موسط فكل واحد من موضعى هم نز اذًا موسط فلان مربع هد موسط فهو اما مشارك لموضع هم او لموضع نز او ليس هو مشاركا[398] ولا لواحد منهما لانه ليس يمكن ان يكون مشاركا لكليهما والا صار موضع هم مشاركا لموضع نز اعنى موضع ست يشارك تر اى ان خط فت مشارك لخط تر وقد وضع هذان متباينان[399] فى الطول فليكن مربع هد مشاركا لاحد موضعى هم نز فلان كل واحد من موضعى هم نز موسط وهما متباينان فخط مد اذًا فى القوة مشارك لخط مز ولان مربع هد مشارك لاحد موضعى هم نز يكون خط Pag. 65 § 32

هد فى الطول مشاركا لاحد خطى مد مز فاحدهما اذا موسط وهما فى
القوة مشتركان فالخط الباقى اذا موسط لان الموضع المشارك للموسط موسط
والقوى على الموسط موسط فخطا مد مز اذا موسطان فى القوة مشتركان
ولان الذى يحيط به هد مد موسط وكذلك ايضا الذى يحيط به[400] هد
مز فالذى يحيط به دم مز لا محالة مشارك لاحدهما اذ كان خط هد فى
الطول مشاركا لاحد خطى مد مز فالموضع اذا الذى يحيط به دمز موسط
فخط دز[401] اذا منفصل[401] الموسط الثانى وان كان مربع هد غير مشارك
لكل واحد[402] من موضعى هم تز فخط هد اذا نسبته الى كل واحد من Pag. 66
خطى مد مز كنسبة موضع موسط الى موسط مباين له فكل واحد من
خطى مد مز فى القوة مشارك لخط هد ولان موضع هم مباين لموضع نز
وخط دم فى الطول مباين لخط مز فخطا مد مز موسطان فى القوة مشتركان
والذى يحيطان به اما ان يكون منطقا او موسطا فخط دز اذا منفصل
الموسط اما الاول واما الثانى فقد وجدنا عند ما نظرنا فى جميع الخطوط
الصم التى بالتفصيل[403] ان مربعاتها[403] اذا اضيفت الى خطوط موسطة
احدثت اما منفصل الموسط الاول او منفصل الموسط الثانى كما احدثت
مربعات الخطوط التى بالتركيب الخطين المقابلين لهما اعنى الذى من موسطين
الاول والذى من موسطين الثانى

وقد يمكنا ان نضيف اضافاتها بانواع كثيرة وذلك ان مربع الموسط § 33
ايضا اذا اضفته الى كل واحد من التى بالتركيب وجدت عرضه واحدا من
التى بالتفصيل وهو المقابل له كما بينا انفا واذا اضفته الى كل واحد من التى
بالتفصيل وجدت عرضه واحدا من التى بالتركيب المقابل له وذلك ان

الموضع الموسط وهو مربع الموسط اذا احاط به خطان مستقيمان فكان احدهما واحدا من الخطوط الصم التى بالتركيب كان الباقى المقابل له من التى بالتفصيل وبعكس ذلك وهذا شيء قد تبين فيما قبل وقد يمكننا اذا اضفنا مربعات الصم التى بالتركيب الى التى بالتفصيل[404] ان نطلب العروض وايضا اذا اضفنا المربعات[405] التى بالتفصيل الى التى بالتركيب وذلك انا متى جعلنا الاضافات الى الخط الموسط او الى الخطوط التى بالتركيب [او الى التى بالتفصيل][404] اتينا بعده كثيرة من المعانى الداخلة فى هذه الاشياء ورأينا اصنافا من المقدمات وقد نكتفى بما وصفنا اذ كان فيه | تذكرة Pag. 67
موجزة[406] فى جملة العلم بالخطوط الصم لانا قد علمنا العلة التى من اجلها احتاج الى الاضافات وهى[407] الاشتراكات

§ 34 وقد علمنا ايضا علما كافيا ان عدد الصم كثيرة بل هو بلا نهاية اعنى التى بالتركيب والتى بالتفصيل والخط الموسط[408] نفسه كما بين اوقليدس لما حكم بانه قد يكون من الخط[409] الموسط خطوط اخر صم بلا نهاية لا[410] بحسب نوع الخطوط التى تقدم وصفها وان كان يحدث من الخط الموسط خطوط بلا نهاية فما قولك فيما يحدث من سائر الصم الباقية على الترتيب وعلى غير الترتيب من البين عند كل احد انه قد يمكنك ان تقول انه قد يحدث من ذلك عدة غير متناهية مرارا[411] متناهية

§ 35 ولكن قد نكتفى بما قلنا فى الصم وقد يمكننا من هذه الاشياء ان نبحث عما يسئل عنه من هذه المسائل اعنى اذا كان خط منطق وخط اصم اى الخطوط هو الموسط بينهما فى النسبة واى الخطوط ثالثها فى النسبة على ان المنطق يوضع الاول ثم يجعل ايضا الثانى وكذلك يجرى الامر فى

17*

كل واحد من الصم على حدته مثال ذلك ان نعلم اذا كان لنا خط منطق
والذى من اسمين او المنفصل اى الخطوط هو الوسط بينهما فى النسبة
وايها[412] ثالثهما فى النسبة وكذلك الحال فى الخطوط الباقية وايضا اذا
كان لنا خط موسط وباقى منطق او واحد من الخطوط الصم فانه قد
يمكننا ان نعلم ايها[413] هو الخط الموسط بينهما فى النسبة وايها[413] هو ثالثهما
فى النسبة وذلك انه لما كانت لنا عروض اضافاتها محصلة وعلمنا ان الذى
يحيط به الطرفان مساو لمربع المتوسط سهل استخراجنا لذلك *

Pag. 68 | تمت المقالة الثانية وتم تفسير المقالة العاشرة من كتاب اوقليدس
نقل ابى عثمن الدمشقى والحمد لله وصلى الله على محمد واله وسلم

كتبه احمد بن محمد بن عبد الجليل
بشيراز فى شهر جمادى الاولى
سنة ثمان وخمسين
وثلثماية.

NOTES ON THE TEXT.

(1) There is no general title to the whole treatise. The first general title which WOEPCKE gives, تفسير المقالة ..... لبلس, is an adaptation of the title of Book 11 of the treatise. The second is the title of Book 1 of the treatise minus the first phrase, المقالة الاولى من.

WOEPCKE's title to Book 1 is a combination of the first phrase of the title of Book 1 and his own first general title to the treatise. The phrase, — بسم الله الرحمن الرحيم, adopted by WOEPCKE, is manifestly an addition either of the Arab translator, or more probably of the copyist.

WOEPCKE reads بلس instead of بيس, deceived evidently by a trick of the copyist who, whenever three such letters as "B", "T", "TH", "N", "Y", follow one-another in succession in an Arabic word, prolongs almost invariably the upward stroke of the second more than usual; as, for example, in يبتدى (p. 4, l. 10); يبين (p. 5, l. 4); اثبتها (p. 12, l. 4); فبينها (p. 32, l. 3); ينبغى (p. 32, l. 6); فينبغى (p. 30, l. 3ft.); تبين (p. 42, l. 13); تبين (p. 42, l. 11); تبينه (p. 48, last.).

Some words in the margin which I cannot decipher, may be a note on ذكر, which has in the M. S. a sign over it. ذكر evidently means "Exposition" (See Lane's Dictionary, 111, 969, col. 111). WOEPCKE translates "Mention".

(2) الاسطقسات gl. m.

(3) ووقوعا على استخراج gl. m. WOEPCKE read تابن instead of تاتى. Syntactically تاتى is in the same relation as the preceding كان. وقوعا would be an accusative of respect in the same relation as جبلة.

(4) Conj. (WOEPCKE). فى كتابات t.

(5) فنونا gl. m.

(6) The MS. has خبر by haplography for اخبر after كنا. There is, then, a supralinear gloss to اخبر, namely, اقتص, and also a marginal gloss,

namely, اخبر واقتص. The marginal gloss probably serves the purpose of giving clearly the correct reading of the text and also the supralinear gloss.

(7) Gl. m. اوودىمس t.

(8) اظهر gl. m.

(9) The marginal gloss, which it is impossible to decipher, must be some word meaning, Respect, Veneration, or Honour, such as مدح, or مرّة or مزيّة. See J. L. HEIBERG's *Euclidis Elementa*, Vol. V, p. 417, ll. 19—20, where the Greek equivalent of the Arabic phrase is given.

(10) ان قد استفاض فيهم gl. m.

(11) بالحياه gl. m.

(12) صفته gl. supra.

(13) مرور التكون gl. m. WOEPCKE read مدود التكون. مرور is probably the Greek ἡ ῥοή. الكون and التكون are synonyms as used here.

(14) Conj. ما | فهذه t. The ا is more likely to be a dittograph than the ه; and gramatically the feminine is to be preferred.

(15) Gl. m. عيانه t.

(16) العوارض gl. supra.

(17) I read *للمار* with SUTER instead of WOEPCKE's and the MS's للماز.

(18) From وليتأمل to قصدنا is given in the margin.

(19) المشترك و is added in the margin.

(20) والمنطق is added in the margin.

(21) تتصوّر gl. m.

(22) Gl. m. فاذ t.

(23) والمساوى m.

(24) A curious case of haplography has occurred here. In the first place the copyist omitted the first الوقوف: then his eye slipped from the first to the second الحركة; and finally in supplying the omissions in the margin, he began with the second الوقوف, neglecting the first and also the phrase after the first الحركة. The part given in the margin can be read with the exception of one word, of which two letters can still be deciphered and which can be conjectured from the context. For, as a matter of fact, the same word occurs in another form in the very next line (مؤدّيه, [يؤ]دّون). I have, therefore,

reconstructed the text on this basis, enclosing, within square brackets what is not given in the text or in the margin.

(25) فاما فى الاعظام فالامر gl. m.

(26) [فى [التقسيم gl. supra.

(27) Gl. m. والواحد مقابل للكثرة t.

(28) The MS. has مستوى quite distinctly, which could be taken as the pass. partic. of the eighth stem. WOEPCKE gives the commonly used act. partic., and his emendation is probably to be accepted.

(29) Conj. (WOEPCKE): lacking in the MS.

(30) المثبت gl. supra.

(31) Gl. m. علل تباين t.

(32) فقط m.

(33) الطول و m.

(34) والتباين to فى النسبة m.

(35) Conj. (WOEPCKE). منطق t.

(36) يتصوّر gl. supra.

(37) ما m.

(38) Conj. (WOEPCKE). التى t.

(39) الطول و m.

(40) مثل gl. supra.

(41) Conj. (WOEPCKE). منطقة t.

(42) WOEPCKE conjectures يولد.

(43) اخر m.

(44) اصغر من قدر m.

(45) اقل gl. supra.

(46) WOEPCKE read تمتلعه.

(47) فقير gl. supra.

(48) عددنا ? gl. supra. It reads قد.

(49) قد m.

(50) الوهم gl. supra.

(51) ونسبه m.

(52) Conj. (WOEPCKE). اواسا t. The second ا is evidently a dittograph.

(53) القدر gl. m. العدد is used as a gloss to القدر p. 7, l. 13, note 8 (para. 6). The two words are synonyms in paras. 11, 14, and 15; p. 11, l. 21, p. 12, l. 1, p. 14, ll. 13, 15, p. 16, ll. 3—4.

(53a) ايضا gl. m.

(54) وايضا فينبغى gl. m.
(55) على الاطلاق فى الاعظام المتناهية gl. m.
(56) يقال gl. m.
(57) انها gl. m.
(58) المحصّلة gl. supra.
(59) لانه ايضا قد يوجد فى الاشتراك gl. m.
(60) تكون m.
(61) العدد gl. supra.
(62) The MS. gives لانعلم with نا above the line after لا.
(63) معروف m.
(64) Gl. m. يكن t.
(65) Conj. (WOEPCKE). اصما t.
(66) لامحالة m.
(67) كانت is given in the margin to be inserted after لما.
(68) المتتابعة gl. m.
(69) ارفع من طبيعة gl. m. WOEPCKE read محاورة.
(70) اقل gl. m.
(71) ومعلم is added here in the margin.
(72) لبعضها m.
(73) الثالوث gl. supra.
(74) للكل m.
(75) وتحصل gl. m.
(76) تنقد gl. supra.
(77) يعرق gl. m.
(78) فى gl. supra.
(79) الانواع gl. m.
(80) التوسط to والاخر m.
(81) WOEPCKE read تشبه. The Greek is ἔοικεν (J. L. HEIBERG, *Euclidis Elementa*, Vol. V, p. 485, l. 3).
(82) جعل gl. supra.
(83) يقلب gl. m.
(84) Gl. m. السبب t.
(85) لكن شى بعد شى منها gl. m. WOEPCKE read لكنه.
(86) A supralinear gloss adds ه.
(87) WOEPCKE conjectures فما, reading فيما. But the text is undoubtedly فيهما.

(88) تحصيل gl. m.

(89) Conj. (WOEPCKE). موافقه t.

(90) ناوشة gl. m.

(91) ايضا gl. m.

(92) The MS. has واحد at the end of the line, and الا انه at the beginning of the next. Obviously the first ا of the second line belongs to واحد.

(93) Gl. supra. الواحد t.

(94) تحدان gl. supra.

(95) على مذهب m.

(96) The MS. has فبيد ان; but the "Ya" is palpably an addition. An asterisk appears above the word, which may serve to draw attention to the introduction of the "Ya" or to indicate that the introduction is an error. Cf. a similar case in Part II, para. 34.

(97) و[هذا] ما يتهيا للانسان gl. supra.

(98) Conj. (WOEPCKE) مشتركين t. مشار[كين] gl. supra.

(99) التى gl. m.

(100) كانت gl. m.

(101) يحذر الخطوط t; يحدون للخطوط gl. m.

(102) ذلك gl. m.

(103) The MS. reads, or seems to read, فضحك منه بجميع; but the "Fa" may be a "Ya" somewhat thickly written. The marginal gloss runs: يضحك منه جميع, not just يضحك as in WOEPCKE. بجميع would seem to be the better reading after جهل. See Trans., Part 1, note 88.

(104) اعنى m.

(105) Conj. (WOEPCKE). منطق t.

(106) اظهر gl. supra.

(107) والاقتران gl. supra.

(108) القدر gl. m.

(109) [الو]حدة gl. supra.

(110) تقصد gl. m.

(111) WOEPCKE suggests تجد as a correction; but it is unnecessary.

(112) Gl. m. واما t.

(113) Conj. (WOEPCKE). احدهما t.

(114) تحصيل m.

(115) على الحقيقة طبيعة gl. m.

(116) والحدود gl. m.

(117) نبحث gl. supra.

(118) للخط المفروض gl. m. See Trans., Part 1, note 108.

(119) Conj. (WOEPCKE). واصما t.

(120) Conj. (WOEPCKE). اصما t.

(121) محصّله gl. m.

(122) العلم gl. m. See Trans., Part 1, note 113.

(123) مشتركة to كانت m.

(124) اذا m.

(125) نما t., فا m.

(126) WOEPCKE proposes مشاركين as a better reading. Gramatically he is justified; but in usuage مشترك is often found in this sense.

(127) Conj. (WOEPCKE). المشتركة t.

(128) After اخر the MS. has بقدر الخط المفروض ايضا. WOEPCKE quite correctly omitted them. See Translation and note.

(129) فى الطول is added in the margin.

(130) بالسطح gl. m. (130b) مشاركين t.

(131) السطح gl. m.

(132) السطح gl. m.

(133) Conj. (WOEPCKE). مساحيه t.

(134) فى الخطوط انفسهما m.

(135) فيقيسها gl. m.

(136) المتعلقة انفسها m.

(137) سبب m.

(138) Conj. (WOEPCKE). يرى بقدر t.

(139) WOEPCKE read: وهولاء تشعر. See Trans., Part 1, note 138.

(140) ان m.

(141) Conj. (WOEPCKE). واحد t.

(142) فلذلك gl. m.

(143) WOEPCKE suggests مشتركة as a better reading. But it is possible that the same phrase as in the previous clause is to be understood.

(144) كل to للخط m.

(145) Conj. (WOEPCKE). الطول t. See Translation and note.

(146) Conj. (WOEPCKE). لذلك t.

(147) خطان m.

(148) خطان m.

(149) Conj. (WOEPCKE). منطقين فى الطول t. See Trans., Part 1, note 154.

(150) Gl. m. ميز t.
(151) والتباين to وذلك m.
(152) منطق m.
(153) Conj. (WOEPCKE). اصما t.
(154) Conj. (WOEPCKE). من الذى من t.
(155) Conj. (WOEPCKE). The MS. does not give هو . اصم to الذى m.
(156) بل قد gl. m.
(157) Gl. supra. وهى t.
(158) Gl. m. نعلم t.
(159) Conj. (WOEPCKE). احدهما t.
(160) الذى m.
(161) Conj. (WOEPCKE). كله مركب t.
(162) Sic تلوا t.
(163) Gl. m. فالمربع t.
(164) اذا m.
(165) يسمى to اصم m.
(166) المركبة m.
(167) ان تفصلها m.
(168) Conj. (WOEPCKE). اصم t.
(169) الجزء to انا m.
(170) Conj. (WOEPCKE). فى التركيب t. The text of the MS. is, however, quite intelligible as it stands.
(171) Gl. m. ينبغى t.
(172) بهذا m.
(173) فتصرف gl. supra.
(174) The MS. has انها after ذكر. It is probably an interpolation. The Greek has nothing corresponding to it. See J. L. HEIBERG, ***Euclidis Elementa***, Vol. V, p. 483, no. 133, ll. 11—15, esp. l. 14.
(175) Conj. (WOEPCKE). مشتركان t.
(176) فقط to مشتركين m.
(177) Conj. (WOEPCKE). مشتركين فى الطول t.
(178) Conj. (WOEPCKE). الاول t. Perhaps we should read يجعل. Cf. يأخذ two lines later.
(179) منطقا to به m.
(180) به m.
(181) Conj. (WOEPCKE). التى t.

(182) Woepcke omits this sentence. But it is presumably the Arabic equivalent of the Greek clause: ἣν ἔχουσιν αἱ κατὰ σύνθεσιν ἄλογοι πρὸς ἀλλήλας, which is represented, then, in the Arabic not only by the status constructus, but also by this sentence. See J. L. Heiberg, *Euclidis Elementa*, Vol. V, p. 551, l. 23.

(183) Conj. (Woepcke). والمنفصل t.

(184) Conj. (Woepcke). موسط t.

(185) Conj. (Woepcke). وكماين في التركيب t.

(186) في m.

(187) Conj. (Woepcke). عشر t.

(188) الصم to الخطوط m.

(189) Conj. (Woepcke). عشر t.

(190) Conj. (Woepcke). الثاني عشر t.

(191) في gl. supra.

(192) Conj. (Woepcke). اضيف t.

(193) Conj. (Woepcke). الثالث t.

(194) Conj. (Woepcke). الست t.

(195) التي m. At the bottom of this page of the MS., on the left-hand margin, is written: قوبل. "It has been collated" ?, i. e., the MS. copied with another or others.

(196) Gl. supra. المنطقة t. Woepcke read الموزة in the preceding line as المورة. See Trans., Part 11, note 2. The phrase, بسم الله الرحمن الرحيم is manifestly an addition of the Muslim translator or copyist.

(197) عنا m.

(198) باحد t. Woepcke adopted as his reading باخذ, but suggested باحدى in his note.

(199) اصما m.

(200) يتم gl. supra.

(201) واحد m.

(202) ونحد gl. supra. (ويجد ?).

(203) Woepcke read كالحد.

(204) Gl. m. تركب المنطق t.

(205) منفصلة ?. See Trans., Part 11, note 9b.

(206) سطح gl. supra.

(207) وان to فقط m.

([208]) الموضع m.

([209]) After الثال the MS. has خطان, obviously an error, and probably a partial dittograph of the following word.

([210]) Gl. m. المثنى t.

([211]) Conj. (Woepcke). العلم t.

([212]) Conj. (Woepcke). سنصفه t.

([213]) سطح gl. supra.

([214]) فيجب to منطق m.

([215]) Conj. (Woepcke). يحيط t.

([216]) ان m.

([217]) The MS. adds كان in the margin after فان.

([218]) Conj. The MS. has اج for اب and جب for بج from line 2 to line 9. Cf. line 11ff., where the MS. has اب and بج.

([219]) Conj. The MS. has again بج جب.

([220]) Conj. (Woepcke). كلاهما t.

([221]) به conj. Woepcke). It is the usual construction, but not absolutely necessary.

([222]) به m. But the MS. places it after اقليدس.

([223]) Woepcke suggests that قليلا would be better. But قليل is possible.

([224]) خطوط m.

([225]) لا gl. m. لم لا وصف.

([226]) Conj. (Woepcke). المتباينة t. وصف might be read as وضع. Cf. l. 2.

([227]) Conj. (Woepcke). تسميا t.

([228]) Conj. (Woepcke). منطقا والذى يحيطان به موسطا t.

([229]) موسطا to مربعيهما m.

([230]) Conj. (Woepcke). لاللذين t. A case of haplography, the ا of اللذين omitted after the ا of لا.

([231]) Conj. (Woepcke). ومربعيهما t.

([232]) Conj. (Woepcke). ومربعيهما t.

([233]) Conj. (Woepcke). متباينين t.

([234]) Conj. (Woepcke). منطقين t.

([235]) Conj. (Woepcke). اج t.

([236]) Conj. (Woepcke). فربع t.

([237]) Conj. (Woepcke). The MS. lacks منطق.

([238]) مشتركين m.

(239) Conj. (WOEPCKE). ولنصف t.
(240) Conj. (WOEPCKE). لمربعى t.
(241) Conj. (WOEPCKE). ما t.
(242) Conj. (WOEPCKE). كل t.
(243) Conj. (WOEPCKE). منطقين t.
(244) Conj. (WOEPCKE). منطقان t.
(245) Conj. (WOEPCKE). واما الموسطة t.
(246) منطقا to به m.
(247) Gl. m. يستخرج t. But an "Alif" has been written over the "Ya" of يستخرج in the MS.
(248) Conj. فليلقى t. WOEPCKE adopted فلنكتف. The copyist probably wrote فليلقى in error for فليكفى, itself an error for فليكف.
(249) Conj. احدث t.
(250) Conj. (WOEPCKE). يصير does not occur in the MS.
(251) Conj. (WOEPCKE). فلتفصيل t.
(252) Conj. (WOEPCKE). بالتركيب t.
(253) Read مفصّلة? See Trans., Part 11, note 9b.
(254) Conj. (WOEPCKE). لذلك t.
(255) Conj. (WOEPCKE). من t. (255b) متجانسين t.
(256) Conj. (WOEPCKE). مرتين is lacking in the MS.
(257) Conj. (WOEPCKE). اعظم t.
(258) WOEPCKE suggests that the phrase, والذين يحيطان به موسطا, should be added here to the text. Although not strictly necessary, the phrase completes the argument.
(259) WOEPCKE inserts here; مربعى اب بج مساو الذى يحيطان به مرتين والذى من. The insertion is not necessary. The sense is quite clear without it, although the clarity of the argument is aided by it. See Trans., Part 11, note 82.
(260) Conj. (WOEPCKE). خطين t.
(261) Conj. (WOEPCKE). اب t.
(262) Conj. (WOEPCKE). موسط t.
(263) Conj. (WOEPCKE). اب t.
(264) Conj. (WOEPCKE). ليس نفصل t. The text of the MS. is possible.
(265) Gl. m. يفضل من المنطق t. بمنطق .... يفضل المنط gl.
(266) WOEPCKE rejects ننتزع and suggests ينتزع.

(267) Conj. (WOEPCKE). المحيطين t.
(268) Conj. (WOEPCKE). موسطه t.
(269) Conj. (WOEPCKE). الخطين اللذين t.
(270) Conj. (WOEPCKE). الموسطه t.
(271) Conj. (WOEPCKE). بالموسطه t.
(272) and (273) Conj. (WOEPCKE). Not in the MS. The scribe's eye wandered probably from the first الذى before يقوى (272) to the second before يحمل.
(274) Gl. m. القينا t.
(275) Conj. اثنان not in the MS.
(276) So given in the MS; for منفصل الموسط; cf. the following text.
(277) Conj. (WOEPCKE). مشتركان t.
(278) الكل m.
(279) Conj. (WOEPCKE). القوة t.
(280) Conj. (WOEPCKE). موسط t.
(281) Conj. (WOEPCKE). موسط t.
(282) Conj. (WOEPCKE). تحيط به بالاصاغر t.
(283) Conj. (WOEPCKE). فيقوى t.
(284) Gl. supra. بالتفصيل t.
(285) Conj. (WOEPCKE). خطا t.
(286) The MS. has لان simply without the ى. WOEPCKE conjectured وكان.
(287) Conj. (WOEPCKE). فذا t., which is possible.
(288) Conj. اما الاولة t. Cf. p. 48, last line, where context and construction are similar.
(289) Conj. (WOEPCKE). منطق t.
(290) Conj. (WOEPCKE). والرابع t.
(291) Conj. (WOEPCKE). اصما t.
(292) Conj. مباينة t. See Trans., Part II., note 114.
(293) Conj. (WOEPCKE). التاليقى t.
(294) Conj. (WOEPCKE). خطين مستقيمين t.
(295) Conj. (WOEPCKE). واحد t.
(296) Conj. (WOEPCKE). التاليقى t.
(297) Conj. فان خطا اب بج منطقين فى العوة مشتركين t. WOEPCKE suggestes: — فان خطى اب بج منطقان فى القوة مشتركان. Cf. p. 48, l. 6, where the next case is stated.
(298) Conj. (WOEPCKE). للمربع t.

(299) Conj. (Woepcke). موسط t.

(300) الصم to الخطوط m.

(301) Woepcke read تبين.

(302) Woepcke suggests بانه. Better perhaps to read simply انه. Observe that the correlative of اما is the ف before ينبغى.

(303) Conj. (Woepcke). واحد t.

(304) Woepcke omits the و, considering it an error.

(305) Conj. (Woepcke). اب t.

(306) Conj. (Woepcke). فربعي t.

(307) Conj. (Woepcke). زجب t.

(308) Conj. (Woepcke). زجب t.

(309) Conj. (Woepcke). نزا t.

(310) Conj. (Woepcke). نزا t.

(311) Conj. (Woepcke). وليكن t.

(312) Conj. (Woepcke). التى تحيط t.

(313) Conj. (Woepcke). از t.

(314) Conj. (Woepcke). منطقا t.

(315) Conj. Not in the MS. See Trans., Part 11, note 126.

(316) So given here and subsequently for المنفصل.

(317) As Woepcke says, we should here read, من الذى من, since as the text stands, من here fulfills two functions: (1) As part of the name, من موسطين الثانى, (2) As indicating, "The square upon".

(318) Conj. (Woepcke). على t.

(319) Conj. (Woepcke). خطين مستقيمين t.

(320) من m.

(321) ولكن to بالتفصيل m.

(322) Conj. (Woepcke). مشتركين t.

(*) The figure is not given in the MS.

(323) The clause beginning كان الموضعان, ll. 22—23, may be a circumstantial clause. It might be better to suppose, however, that an اذ or even اذ قد had been omitted before كان.

(324) خطان m.

(325) وهو m. It is possible that وهو should be placed before الآخر.

(326) الصم m.

(327) Conj. (Woepcke). بح t.

(328) Conj. بج t. Woepcke accepted the text of the MS. here.
(329) Woepcke suggests جد.
(330) Conj. (Woepcke). مشتركين t.
(331) التى to الخطوط m.
(332) Woepcke read نحن.
(333) Conj. والمنفصل المقابل له t. Possibly we should read: الخط الذى من اسمين والمنفصل المقابل له.
(334) قوة m.
(335) Conj. (Woepcke). مشارك t.
(336) Conj. (Woepcke). مشارك t.
(337) Conj. (Woepcke). كليهما t. Cf. p. 56, l. 1.
(338) Conj. (Woepcke). مشارك t.
(339) يصير m.
(340) Conj. (Woepcke). انّ is lacking in the MS.
(341) Conj. (Woepcke). اضيف t.
(342) Conj. (Woepcke). واحد t.
(343) Conj. (Woepcke). اضيف t.
(344) Conj. (Woepcke), The MS. does not give منطقا.
(345) Conj. (Woepcke). نخط t.
(346) Conj. (Woepcke). يكون من الذي not given in the MS.
(347) Conj. (Woepcke). او not given in the MS.
(348) Conj. (Woepcke). نخط t.
(349) Conj. (Wopecke). هز t.
(350) Conj. (Woepcke). هز t.
(351) Gl. m. وسم t.
(352) Conj. (Woepcke). هز t.
(353) Conj. (Woepcke). بز t.
(354) Conj. (Woepcke). هز t. A supralinear gloss gives د ? for ز.
(355) Conj. (Woepcke). هز t. A supralinear gloss gives د for ز.
(356) Conj. (Woepcke). المرسوم يكون هل وموضع t. يكون هل is probably a supralinear gloss which has crept into the text, هل (i. e. DC) being the line upon which the square is described.
(357) Conj. (Woepcke). بز ? t.
(358) Conj. (Woepcke). موسطا t.
(359) Conj. (Woepcke). منطق t.

(360) Conj. (WOEPCKE). موسط t.
(361) Conj. (WOEPCKE). ولنصف t.
(362) Conj. (WOEPCKE). لموضع t.
(363) Conj. (WOEPCKE). ب t.
(364) Conj. (WOEPCKE). بز t.
(365) Conj. (WOEPCKE). نز t.
(366) Conj. (WOEPCKE). بز t.
(367) Conj. (WOEPCKE). ثن t.
(368) Conj. (WOEPCKE). فالذى من مربع هد t.
(369) Conj. (WOEPCKE). هز t.
(370) Conj. وخط مز t. WOEPCKE suggests مد reading the preceding line as مر.
(371) Conj. (WOEPCKE). هز t.
(372) احد (واحد ?) should be added here, says WOEPCKE.
(373) Conj. (WOEPCKE). هز t.
(374) The MS gives ولأن. WOEPCKE suggests لأن. The context demands some such word as "When", or "As soon as" (لمّا). The Greek text had evidently some such phrase as ἐπειδή δε or ὅτε δε, which the Arab translator took in its causal instead of in its temporal sense.
(375) Conj. (WOEPCKE). بز t.
(376) Conj. (WOEPCKE). نخط دز اذا موسط نخط دن اذا من موسطين t. Clearly a case of haplography.
(377) Conj. (WOEPCKE). مشارك فى القوة t.
(378) Conj. (WOEPCKE). وخط مد دن t.
(379) Better perhaps والذى بينهما. Cf. p. 46, ll. 4 & 22.
(380) WOEPCKE suggests that the words, ان كان خط اب المنفصل be added at this point.
(381) In this part of the MS. the letters designating the lines of the figure have been rather carelessly written, but there are no real errors as WOEPCKE seems to claim.
(382) Conj. (WOEPCKE). خطا t.
(383) Conj. (WOEPCKE). خطا t.
(384) Conj. (WOEPCKE). الثانى t.
(385) Conj. ومهتان t.

(386) Conj. (WOEPCKE). يحيط t.

(387) Conj. (WOEPCKE). موسطان not given in the MS.

(388) الموسط m.

(389) Conj. (WOEPCKE). المنفصل t.

(390) Conj. (WOEPCKE). مشتركين او متباينين t.

(391) Conj. والذى t.

(392) Conj. وهذان t.

(393) WOEPCKE suggests منطقا. But ب with the genitive is also correct.

(394) Conj. (WOEPCKE). يحيط t.

(395) Conj. (WOEPCKE). واحد t.

(396) Conj. (WOEPCKE). موسط t.

(397) Conj. (WOEPCKE). مساو t.

(398) مشارك m.

(399) WOEPCKE remarks: — Thus the text, better متباينين.

(400) Conj. (WOEPCKE). به not given in the MS. It is not necessary.

(401) Conj. (WOEPCKE). اذا موسط منفصل t.

(402) Conj. لواحد t.

(403) Conj. (WOEPCKE). ان من مربعاتها t.

(404) ان to بالتركيب (3 lines later) m. The phrase within square brackets an emendation suggested by SUTER.

(405) WOEPCKE remarks: — Thus the text, better مربعات.

(406) WOEPCKE read موحدة.

(407) Gl. m. وفوا t.

(408) Conj. (WOEPCKE). المنطق t.

(409) Conj. (WOEPCKE). الخطوط t.

(410) Conj. See Trans., Part 11, note 173.

(411) Conj. See Trans., Part 11, note 174.

(412) Conj. (WOEPCKE). ايهما t.

(413) WOEPCKE read انما in both cases.

GLOSSARY
OF TECHNICAL TERMS.

In the following glossary *W.* indicates WOEPCKE's text of the Treatise of Pappus, printed in Paris by the firm Didot*; *BH.* indicates Codex Leidensis 399, 1, Euclidis Elementa ex interpretatione Al-Hadschdschadschii cum commentariis Al-Narizii, BESTHORN and HEIBERG, Part 1, Fascicule 1; *H.* indicates Euclidis Elementa, J. L. HEIBERG, Leipzig, 1888, vol. V; *Spr.* indicates A Dictionary of the Technical Terms etc., A. SPRENGER, Calcutta, 1862; *T.* indicates Euclid's Elements, translated from the Greek by Naṣīr ad-din aṭ-Ṭūsī, Rome 1594; "*Heath*" indicates The Thirteen Books of Euclid's Elements, T. L. HEATH, 1908.

ا

اخذ To take for granted, to assume (W., p. 47, l. 20). Cf. المأخوذة, "Adsumptum" (Lemma) (BH., I, pp. 38—39).

ماخوذ Given (W., p. 49, l. 1; "The given line").

الاسمين The two terms of a binomial (or major etc.) (W., p. 58, l. 16).

ذو الاسمين The Binomial (W., p. 2, l. 3; p. 20, l. 20; p. 21, l. 6, etc.)

الخطّ الذى من اسمين The Binomial (W., p. 25, l. 15; cf. W., p. 21, ll. 8—9; p. 22, l. 4; p. 25, l. 21).

من اسمين A Binomial (W., p. 25, ll. 11, 12; p. 33, l. 13; p. 43, l. 10).

خطّ من اسمين A Binomial (W., p. 21, l. 18).

الخطوط التى من اسمين The Binomials (W., p. 55, l. 3; cf. (W., p. 26, l. 2).

خطوط من اسمين Binomials (W., p. 55, l. 15).

الخطّ الذى من اسمين الاول The First Binomial (W., p. 25, l. 22).

* WOEBCKE's pagination has been indicated in this edition of the Arabic text in the margin.

الخطّ الذى من اسمين الثانى The Second Binomial (W., p. 25, l. 23).

الذى من ثلثة اسماء The Trinomial (W., p. 21, ll. 10, 19).

من ثلثة اسماء Trinomial (W., p. 22, l. 5).

الذى من اربعة اسماء The Quadrinomial (W., p. 21, l. 11).

الاصول The Elements (i. e., of Euclid). Greek, στοιχεῖα. Gloss, الاسطقسات (W., p. 1, l. 1).

تاليف Harmony (e. g., Theaetetus assigned the apotome to harmony) (W., p. 2, l. 3).

ب

مبدأ Beginning or Principle of a thing (As "One" of the numbers) (W., p. 4, l. 5).

تبديل The Difference between or the Variance from one-another. A synonym of اختلاف. (W., p. 56, l. 6).

بُعد Extension (W., p. 14, l. 2). Distance or extension between things; shortest distance between things (Spr., Vol. 1, p. 115). Greek, διάστημα.
Radius (BH., I, p. 20, l. 11).

الباقى The Remainder after subtraction (T., Book X, p. 226). Greek, τὸ καταλειπόμενον.

الذى بينهما The rectangle contained by the two of them (i. e., the two lines, A and B) (W., p. 46, l. 4; cf. p. 46, l. 22). Synonymous with — الذى يحيطان به.

تباين Incommensurability (W., p. 4, l. 17). It is the opposite of اشتراك q. v.

متباين Incommensurable (W., p. 31, ll. 3, 20). Greek, ἀσύμμετρος. It is the opposite of مشترك. q. v.
Prime (of numbers to one-another) (T., Book VIII, p. 169). Greek, πρῶτοι πρὸς ἀλλήλους.

ت

متابعة A Progression (and Retrogression) of Multitude (W., p. 8, l. 17, n. 5). Greek, προποδισμός (ἀναποδισμός).

ث

ثلثة The Triad (W., p. 9, l. 6; cf. Translation, Part I, note 52) The Greek is given, H., Vol. V, p. 484, l. 23, ἡ τρίας.

مثلّث Triangle (W., p. 50, l. 20).

ج

جزء The Part (of a line or a magnitude) (W., p. 4, l. 7; p. 39, l. 11). It is the opposite of جملة. q. v.

Part (i. e., in the restricted sense of a submultiple or an aliquot part (T., Book V, p. 108). Greek, μέρος.

جعل (With Acc. and على). To multiply (e. g., length by breadth) (W., p. 16, ll. 21—22).

مَجْمُوع The Sum (of lines or magnitudes) (W., p. 34, l. 5; p. 40, l. 20). Greek, τὸ ὅλον.

مجتمع The Sum (of squares upon two lines) (W., p. 32, l. 19).

اجتماع Union or Combination (W., p. 13, l. 9). Greek, ἡ σύγκρισις?

جملة The "Whole" (of a magnitude) (W., p. 3, l. 8; p. 4, l. 7). It is the opposite of جزء (Part). q. v.

The Sum (of two lines; i. e., the whole line composed of the two lines (W., p. 32, l. 14). Cf. the phrase, جملة الخط (The whole line), l. 12 of the same page.

Chapter or Part of a Book (W., p. 23, l. 10; p. 26, l. 7). The Greek is given, H., Vol. V., p. 485, l. 11; p. 548, ll. 2—5, κεφάλαιον.

متجانسة Homogeneity (W., p. 23, l. 19). The Greek is given, H., Vol. V, p. 484, l. 14, συγγένεια.

متجانس Homogeneous (W., p. 7, l. 2). The Greek is given, H., Vol. V, p. 418, l. 16, ὁμογενῶν.

ح

حجم Bulk or Magnitude (W., p. 14, ll. 2, 5). Greek, ὄγκος.

حدّد To Define (W., p. 11, ll. 14, 15).

حدّ The Limit or Bound (W., p. 9, l. 8; p. 13, l. 13ff.; p. 14, ll. 3, 8). It is the Platonic πέρας of the *Timaeus* and *Parmenides*.

Standard (i. e., a unit of measurement accepted for practical purposes) (W., p. 6, l. 21; p. 7, l. 17).

The point of bisection in a line, the line of bisection in a plane, the plane of bisection in a body (Spr. Vol. 1, p. 285).

تحديد Definition (W., p. 10, l. 6).

محدود Definite or Determinate (W., p. 4, l. 1). The Greek is given, H., Vol. V, p. 426, l. 6, ὡρισμένος.

حدث To arise or be produced (W., p. 39, ll. 15, 16, 17; p. 40, l. 8; cf. p. 34, ll. 10 & 11).

احدث To produce (W., p. 39, ll. 13, 14, 15).

حركة Movement (W., p. 3, l. 19). It is the opposite of وقوف, Rest. q. v.

حصّل في To be comprised or comprehended in (of a thing in its genus) (W., p. 3, l. 4).

حصّل. تحصيل To determine (a thing), i. e., make known its form or character. (W., p. 10, ll. 17 & 21; p. 11, l. 4).

مُحصَّل Determinate or Distinct (W., p. 4, l. 1).

احاط ب To contain (as the sides of a square the square) (W., p. 10, l. 13). Greek, Med., περιέχω.

خ

اخرج To draw (a line) (W., p. 50, l. 3) (Cf. BH. I, p. 16). To produce (i. e., extend a line) (W., p. 50, l. 8) Cf. BH. I, p. 10).

استخراج The finding or discovery of (W., p. 23, l. 19). The Greek is give H., Vol. V, p. 485, l. 15, εὕρεσις.
To prove or demonstrate (W., p. 26, l. 8). The Greek is given, H., V, p. 551, l. 23, ἐπιδεικνύον.

خارج Beyond (i. e., of a line meeting another, AB, for example, beyond the point B, i. e., not within AB, which is داخل) (W., p. 50, l. 10).

خطّ Line.

اختلاط Distinction or Difference (W., p. 20, l. 12). The Greek is given, H., Vol. V, 486, l. 4, διαφορά.

خالف To be the contrary of (i. e., of two homogeneous things to one-another (W., p. 40, l. 19; p. 44, ll. 13, 20, 21).

اختلاف Difference (W., p. 26, l. 8). The Greek is given, H., Vol. V, p. 551, l. 25, διαφορά.
To take the place of one-another (i. e., of areas; e. g., in the forming of the irrational lines sometimes a rational area is subtracted from a medial and sometimes a medial from a rational. Cf. Translation, Part II, para. 16 (W., p. 44, l. 17).

اختلاف الوقوف Case (Casus, πτῶσις) (BH., 1, p. 40, l. 3; see Heath, Vol. 1, Introd., p. 134).

مختلف Unequal (of magnitudes) (W., p. 33, l. 15). Greek, ἄνισος.

ذ

ذراع Cubit (as an unit of measurement) (W., p. 6, l. 14). The Greek is given, H., Vol. V, p. 418, l. 13, πῆχυς.

ذكّر To discuss (teach, explain, show by argument) (W., p. 23, ll. 17, 18; p. 26, l. 3). The Greek is given, H., Vol. V, p. 484, l. 13, and p. 547, l. 24, διδάσκει, διαλέγεται δεικνύων.

مذهب Definition (or Thesis) (W., p. 11, l. 5).

ر

رباطات Bonds (W., p. 9, l. 14). Greek, ὁ δέσμος of *Timaeus*, 31c.

ربّع To "square" a number, i. e., form it into a square figure. Cf. Appendix A. (W., p. 10, ll. 14, 15; p. 11, ll. 5, 7, 14, 15). The Greek is the τετραγωνίζω of *Theaetetus* 148a.

مربّع Square (of a number) (W., p. 11, ll. 1, 3, 4).
Square (of a figure) (W., p. 10, l. 13; p. 11, l. 1).
The sum of the squares upon (W., p. 24, l. 11). But this meaning is derived from the context. Cf. مركّب.

مربّع خطّ هز The square upon HZ. (W., p. 33, l. 1; cf. W., p. 34, l. 3).

المربّع الذى من هز The square upon HZ. (W., p. 33, l. 8; cf. p. 24, ll. 9, 10; p. 25, ll. 5, 6).

الذى من خطّ اج The square upon AJ. (W., p. 40, l. 21; cf. W., p. 57, l. 14ff.; NB. l. 18 the phrase (المربّعات انفسها).

مايكون من مشارك له
ما يكون من مباين له The square upon a line commensurable (incommensurable) with it (W., p. 55, ll. 7—8 etc.; cf. p. 51, l. 16; p. 52, l. 3).

رسم To describe (a square upon a line) (W., p. 58, l. 3; cf. BH., 1, p. 24, l. 18).
Line (W., p. 14, l. 5). Greek, γραμμή.

ارتفاع Height (of a rectangle) (W., p. 59, l. 5).

ركّب شىء على To apply (an angle to an angle, a triangle to a triangle etc.

تركيب Addition (Of magnitudes to one-another) (W., p. 5, l. 2; p. 9, l. 5; p. 20, l. 18; p. 35, ll. 16, 17).

الستة الصم التى بالتركيب The six irrationals formed by addition (W., p. 26, l. 8; p. 40, l. 6). The Greek is given, H., V. p. 551, l. 23, αἱ κατὰ σύνθεσιν. Cf. W., p. 39, l. 9.

الصم بالتركيب The irrationals formed by addition (W., p. 24, l. 15; p. 35, l. 16).

الخطوط المركّبة Compound Lines (i. e., lines formed by addition) (W., p. 20, l. 20; p. 22, l. 12; cf. p. 30, l. 15).

المركّبات Compound Lines (W., p. 23, l. 8).

الخطّان المركّبان The two [incommensurable] lines which have been added together [to from a binomial] (W., p. 25, l. 7; cf. p. 48, l. 21).

المركّب منهما (الطرفين) The sum (of two lines, of the extremes) (W., p. 45, ll. 21, 22).

المربع المركّب من مربّعيهما The sum of the squares upon them (W., p. 25, ll. 3—4). (Cf. W., p. 24, ll. 9—10; p. 25, ll. 5, 6; p. 46, ll. 3—4; p. 41, l. 20; p. 33, ll. 8, 16; p. 36, l. 11).

المركّب من مربّعى هج جز The sum of the squares upon HJ., JZ (W., p. 33, ll. 10, 11, 18, 21; p. 34, ll. 2—3, 8—9, 12, 15, 18; p. 41, l. 19) (Cf. W., p. 33, l. 12).

المركّب The sum of the squares upon them (W., p. 37, l. 10). The sense is evident, however, from the context.

ز

زاوية — زوايا Angle.

على زوايا قائمة At right angles (W., p. 50, l. 4).

القائم الزوايا Rectangle (W., p. 21, l. 22; p. 31, l. 8 etc.).

زيادة Addition (of lines) (W., p. 23, l. 5).

س

سطح Area, Plane (W., p. 17, l. 17). Here it renders the ἐπίπεδος of *Theaetetus* 148b. On page 30, l. 19, it occurs as a gloss for موضع. In T., Book X, p. 268, it gives the Greek, χωρίον). It is used throughout for "Rectangle" (Cf. W., p. 25, ll. 4, 5, 6).

المساوى The Equal (as an abstract idea contrasted with the Greater and the Less, a reference to Plato's *Parmenides*

140b. c. d.) (W., p. 13, l. 6; cf. p. 3, ll. 17, 18, where it is contrasted with the Unequal). Greek, τὸ ἴσον.

غير المساوى The Unequal (W., p. 3, pp. 18, 19; see Equal).

متساويا مرارا متساوية Numbers such as are the product of equal sides (i. e., factors (W., p. 10, l. 12). The Greek is ἴσον ἰσάκις, *Theaetetus* 147e.

ش

شبر Span (W., p. 6, l. 14). The Greek is given, H., Vol. V, p. 418, l. 13, ἡ σπιθαμή.

شبّه (With ب & Acc.) To compare one thing to another, i. e., to liken or represent them as similar (W., p. 19, l. 16). The Greek is given, H., Vol. V, p. 485, l. 17, ἐξομοιόω.

يُشَبِّه ان It seems that (W., p. 9, l. 11; p. 20, l. 5). The Greek is given, H., Vol. V, p. 485, ll. 3, 23. ἔοικεν.

ما اشبه ذلك And such like (W., p. 23, l. 19). The Greek is given, H., Vol. V, p. 484, l. 15. ὅσα τοιαῦτα.

الشبيه Like (W., p. 3, l. 17). See المساوى.

غير الشبيه Unlike (W., p. 3, l. 18). See المساوى.

تشابه Identity of quality or accident (W., p. 2, l. 15; see Spr. Vol. I, p. 792). The Greek, ὁμοιότης probably.

متشابهان Similar (of triangles with similar angles) (W., p. 50, l. 21).

الاشتراك Commensurability (W., p. 2, l. 5). It is the opposite of التباين.

مشارك ل Commensurable (with something or other) (W., p. 18, ll. 7, 8, 9, 10, 11; see especially l. 19). Greek, σύμμετρος.

متشارك Commensurable (with one-another) (T., Book X, prop. 6, p. 230).

مشترك Commensurable (with one-another) (W., p. 18, l. 16, 19).

مشترك Common, e. g., there is no quantity which is common to all quantities (W., p. 3, l. 10); of a characteristic common to several things (W., p. 5, l. 3, N. 3); of an angle made so that it is adjacent to two others and forms with each a larger angle (BH., 1, p. 24, l. 3).

غير مشترك Incommensurable (with one-another). Cf. the use of ἀκοινώνητος H., Vol. V, p. 414, l. 10. Is this the explanation of the use of the root, شرك, to express this idea?

شكل Geometrical figure (W., p. 14, l. 5). Proposition (W., p. 50, l. 1).

ص

مصرّف Of various sorts (W., p. 25, l. 16). The Greek is given, H., Vol. V, p. 534, no. 290, διαποικιλλομένος.

الاصغر The Less (as an abstract idea contrasted with the Greater and the Equal, a reference to Plato's *Parmenides* 140b. c. d.) (W., p. 13, l. 6). Greek, τὸ ἔλαττον. The minor (the irrational line) (W., p. 22, l. 16; p. 26, l. 17).

اصم — صم Irrational (of lines or magnitudes), surd (W., p. 1, l. 2; p. 2, l. 2, and l. 3). Cf. منطق.

صورة Form (Idea), as opposed to Matter (W., p. 13, l. 18; p. 14, ll. 3, 4). Greek, εἶδος.

الصور الهندسيه Geometrical figures (W., p. 14, l. 2).

صيّر To form, produce (e. g., the first bimedial by the addition of two given areas) (W., p. 41, l. 2).

ض

ضلع — اضلاع Side (of a triangle etc.). Greek, ἡ πλευρά.
Breadth (of a rational area (Cf. T., Book X, p. 239, prop. 16 = prop. 20 of our Euclid). Greek, τὸ πλάτος.
Side, i. e., Factor of a number (W., p. 10, l. 14; p. 11, l. 5). The Greek is the ἡ πλευρά of *Theaetetus* 147d.—148b.

اضاف To apply (squares etc. to lines) (W., p. 26, l. 5; p. 30, l. 10; p. 38, l. 6). The Greek is given, H., Vol. V, p. 548, ll. 2—3, παραβάλλω.

اضافة Relation (of quantities to one-another) (W., p. 7, l. 5). The Greek is given, H., Vol. V, p. 418, l. 18, ἡ σχέσις.

ط

الطرفان The Extremes (i. e., of a series of numbers in continued proportion) (W., p. 20, l. 13). Cf. وسط. Greek, οἱ ἄκροι — (See H., Vol. V, p. 486, l. 5).

طعن Doubt, Suspicion (in the phrase, — التى لا يلحقها طعن, meaning, "Irrefutable", W., p. 1, l. 8; p. 2, l. 4). The phrase probably renders the Greek word, ἀνέλεγκτον. Cf. G. Friedlein, *Procli Diadochi in Primum Euclidis Elementorum Librum Commentarii*, p. 44, l. 14.

على الاطلاق Simply, Without Qualification (W., p. 24, l. 19; p. 38, l. 22).

مطلق A "whole" [continuous quantity], i. e., a finite and homogeneous one (W., p. 7, l. 1, N. 2). Cf. Translation, Part I, note 36.

مستطيل Oblong (the figure) (W., p. 10, l. 14).
Oblong (of number, i. e., an oblong number) (W., p. 10, l. 15; p. 11, ll. 4—5). The reference is to Plato's *Theaetetus* 148a. προμήκες. Cf. عدد.

ع

عدد Unit of measurement, measure (W., p. 6, l. 14, N. 9; p. 11, l. 21; p. 14, l. 15; p. 15, l. 2; p. 16, l. 3). See Translation. Part I, note 34.

عدد مربّع A square number (W., p. 11, l. 4; cf. p. 10, ll. 12—14, for its definition, "A number which is the product of equal factors". The reference is to Plato's *Theaetetus* 147e.—148a.)

عدد مستطيل An oblong number (W., p. 11, ll. 4—5; cf. p. 10, ll. 12—14, for its definition, "A number which is the product of a greater and a less factor". See Plato's *Theaetetus* (147e.—148a.).

عدم Cf. النطق , نهاية , تناهى.

عرض — عروض Breadth (W., p. 26, l. 6). Greek, τὸ πλατός (H., Vol. V, p. 548, l. 3).

العوارض الهيولانية Corporeal Accidents (W., p. 14, l. 10).

عظم — اعظام A Continuous Quantity (W., p. 1, l. 2). Aṭ-Ṭūsī says (T., Book X, p. 225, l. 1ff.): —, "The continuous quantities are five, the line, the plane, the solid, Space, and Time". الأعظام (W., p. 7, l. 2) = τὰ μεγέθη of H., Vol. V, p. 418, l. 7. Cf. the phrase, الكمية المتصلة of W., p. 3, l. 14.

الاعظم The major (the irrational line) (W., p. 21, l. 22; p. 26, l. 17 etc.).

The Greater (as an abstract idea contrasted with the Equal and the Less, a reference to Plato's *Parmenides* 140b. c. d.) (W., p. 13, l. 6). Greek, τὸ μεῖζον.

عَكَسَ To convert (the two terms of a proposition) (W., p. 15, l. 6).

عكس The converse (of a proposition) (W., p. 25, l. 8 and l. 14). Cf. H., Vol. V, p. 548, l. 3 with W., p. 26, l. 6. Greek, ἀντίστροφος.

بعكس ذلك Conversely (W., p. 24, l. 10; p. 25, ll. 4—5).

التعاليم Mathematics (W., p. 1, ll. 4 & 9).

معلوم Assigned, Given (of a line) (W., p. 24, l. 1). Greek, προτεθεῖσα.

عمود A perpendicular (line) (W., p. 50, l. 16).

معنى Definition (W., p. 6, l. 7; p. 56, l. 7). Cf. BH. I, p. 40, l. 9.

معوّزة Destitute of quality (W., p. 29, l. 3). See Translation, Part II, note 2.

ف

فرز To cut off (a rectangle from a rectangle) (W., p. 33, l. 1).

مفروض (فرض) Assigned, Given. Greek, προτεθεῖσα (W., p. 8, l. 4).

فَصَلَ To subtract (one magnitude from another) W., p. 22, ll. 15, 18) Greek, ἀφαιρέω.

فصل Subtraction (W., p. 22, l. 18). "Distinctio" (BH., p. 8, l. 5) — distinguit inter enuntiationem ejus, quod fieri potest, et ejus, quod fieri non potest.

تفصيل Subtraction (Division) (W., p. 26, l. 15). Greek, H., Vol. V, p. 553, l. 14, ἀφαίρεσις.

Definition or Specification (Greek, διορισμός) (BH. I, p. 36, l. 5). It states separately and makes clear what the particular thing is which is sought in a proposition (Cf. Heath, Vol. I, Introd., p. 129).

الخطوط الصم التي بالتفصيل The irrational lines formed by subtraction (W., p. 22, ll. 14, 20; p. 26, ll. 12—13; p. 39, l. 9; p. 40, l. 4.

The Greek to p. 26, ll. 12—13 is given, H., Vol. V, p. 553, ll. 11, 14; αἱ δι' ἀφαιρέσεως αἱ κατ' αφαίρεσιν.

الخطوط المنفصلة The irrational lines formed by subtraction (W., p. 20, l. 20).

بالتفصيل The irrational formed by subtraction? (W., p. 40, l. 16).

انفصال Subtraction (W., p. 22, l. 15; p. 42, l. 15).

مفصول Subtracted (e. g., the rational and subtracted area; W., p. 42, l. 21).

منفصل Subtracted from (e. g., the area that is subtracted from a rational area; W., p. 42, l. 16).

Discrete (of quantity) W., p. 3, l. 13). It is the opposite of متصل (continuous).

The apotome (The irrational line) (W., p. 2, l. 3; p. 22, l. 21; p. 26, l. 13). Greek, ἡ ἀποτομή.

المنفصل الاول, الثانى, الثالث The first, second, third apotomes etc. (W., p. 51, ll. 12—14; cf. p. 51, l. 19).

منفصل الموسط الاول (الثانى) The first (second) apotome of a medial (W., p. 22, l. 16; p. 26, ll. 15—16; p. 39, ll. 14—15; p. 43, ll. 13, 16).

منفصل موسط الاول (الثانى) Greek, μέσης ἀποτομὴ πρώτη (δεύτερα).

منفصل الموسطات الاوائل والثوانى First and second apotomes of a medial (W., p. 57, l. 20).

الفضل The Remainder (after the subtraction of one line from another (W., p. 39, l. 11).

ق

مقابل Opposite, contrary (i. e., of two things within the same genus, e. g., the binomial and the apotome) (W., p. 47, l. 14; p. 48, l. 23; p. 53, ll. 11, 13) (Cf. Spr. Vol. II, p. 1205).

متقابلان Opposite (of the sides of a parallelogram) (W., p. 50, l. 12).

قدر Measure or Magnitude (W., p. 3, l. 10; p. 6 (throughout); p. 14, ll. 13, 18). See Translation, Part I, note 28.

مقدار Measure or Magnitude (W., p. 14, ll. 13, 17; p. 6, l. 2ff.). P. 13, l. 7 it gives the τὸ μέτρον of Plato's

	Parmenides 140 b. c. d. Aṭ-Ṭūsī defines it as the relation or proportion of one homogeneous quantity to another, or the measure of one to the other. Greek, τὸ μέγεθος.
مقدار النصف (الثلث)	The ratio of 1 to 2, 1 to 3 (W., p. 7, l. 15).
مقدّمة	Enunciation (of a proposition) (W., p. 46, l. 14).
قسم	To divide (a line). Greek, διαιρέω.
قسمة	Division, Subtraction (W., p. 3, l. 8; p. 9, l. 5; p. 20, l. 18; p. 25, l. 9). Greek, διαίρεσις.
	Term (i. e., one of the two terms of a binomial etc.) (W., p. 55, l. 6). Greek, τὸ ὄνομα.
القسم الاعظم والاصغر	The greater and less terms (W., p. 55, l, 6).
تقسيم	Division (into parts) (W., p. 3, l. 8; p. 4, l. 3).
قطر	Diameter or diagonal (W., p. 21, l. 5) (Cf. BH. 1, p. 20, l. 6).
قاعدة	Base (of a rectangle or square) (W., p. 59, l. 15).
الشىء الذى هو اقلّ قليل	The (A) Minimum (W., p. 3, ll. 7, 9). Greek, ἐλα-χίστον μέτρον (See H., Vol. V, p. 429, l. 27).
شىء هو اقل قليل	
قال	To enunciate, or to say or state in the enunciation, or to give the enunciation (W., p. 36, ll. 1, 3, 6).
قول	The enunciation (of a proposition (W., p. 35, l. 15).
	Proposition or theorem (W., p. 3, l. 1; p. 5, l. 3; p. 10, l. 20; p. 11, l. 19) (Cf. BH. I, p. 36 l. 16).
مقالة	Theorem ? (W., p. 10, l. 17).
	Part or section (of a book) (W., p. 35, l. 18).
قائمة	Right (of an angle) (W., p. 50, l. 7). See زاوية.
متقوم	Established, known, proved, belonging as a property or quality to (W., p. 3, l. 3; p. 4, l. 14). See Translation, Part I, note 12.
مستقيم	Straight (of a line) (W., p. 31, l. 17).
على استقامة	In a straight line (i. e., of the production of a line) (BH., I, p. 18, l. 8) (of the placing of two lines, W., p. 59, l. 9).
قوى على	To have the power to form such and such a square,

i. e., the square upon which is equal to such and such an area etc. (W., p. 11, l. 17; p. 12, l. 1; p. 19, ll. 6, 21, 22; p. 25, l. 21). The phrase, — فان المربّع الذى من الخطّ الموسط مساوٍ للموضع etc. —. p. 19, ll. 6—7, reproduces and means the same as the phrase, ما صار يقوى على الموضع, before it in l. 6. Greek, δύναμαι.

الخطّ الذى يقوى على منطق وموسط / اصم يقوى على منطق وموسط — The (A) side of a square equal to a rational plus a medial area (W., p. 22, l. 1; p. 26, l. 18; p. 35, l. 11; p. 44, l. 1). Greek, ῥητὸν καὶ μέσον δυναμένη.

الخطّ الذى يقوى على موسطين / اصم يقوى على موسطين — The (A) side of a square equal to two medial areas (W., p. 22, l. 2; p. 26, l. 18; p. 35, l. 14; p. 44, l. 4). Greek, ἡ δύο μέσα δυναμένη.

قوّة — Square (W., p. 10, ll. 7, 8, 10, 14, 15, 18; p. 11, ll. 2, 9, 11, 12, etc.; p. 12, l. 1). See Appendix A. Greek, δύναμις.
Square root, surd (W., p. 11, l. 15). See Appendix A. Here قوة renders the δύναμις of *Theaetetus* 148b.
Potentiality or power (W., p. 13, l. 13). Greek, δύναμις.

القوّة المصورة — The representative or imaginative power, the psychological faculty (W., p. 14, l. 5). Greek, δύναμις.

بالقوّة — Potentially (W., p. 13, ll. 17, 18). It is the opposite of بالفعل (actually), p. 13, l. 19. Greek, δυνάμει.

القوي على منطق وموسط — The side of a square equal to a rational plus a medial area (W., p. 44, l. 1). See قوى على etc.

القوي على موسطين — The side of a square equal to two medial areas. See قوى على.

ك

الكثرة — Plurality or multiplicity (W., p. 3, l. 20ff.). It is the opposite of الوحدة (Unity).

الكثرة — Multitude or many (W., p. 3, l. 20ff.). It is the opposite of الواحد (One).

اكثر الكثير Maximum (W., p. 3, l. 13). See اقل قليل.

الكل The sum (of two areas) (W., p. 43, l. 10).

كمية Quantity (quantum) (W., p. 3, l. 13).

كون The coming-to-be or the coming-to-be-and-the-passing-away (W., p. 2, l. 16, n. 9). See Translation, Part I, note 7. In the first case it is synonymous with الحدوث and is the opposite of الفساد (corruption). In the second it is synonymous with such terms as الثبوت, التحقق, الوجود. (Cf. Spr., Vol. II, p. 1274).

Form (W., p. 56, ll. 7, 9, 22). See Translation, Part II, note 136.

الاكوان are the forms or ways in which sensible things exist.

التكون The coming-to-be (W., p. 2, l. 16). It is the emergence of the non-existent from non-existence to existence (Cf. Spr., Vol. II, p. 1276).

ل

اللفق The "annex" (W., p. 22, l. 22; p. 26, l. 21). P. 22, l. 22 it is defined as, الخط المفصول المنطق; i. e., the rational line commensurable in square with the whole line, which, when subtracted from the whole line, leaves as remainder an apotome. Greek, ἡ προσαρμόζουσα.

م

المشاء The Peripatetic (W. p. 2, l. 4).

مع "After" (= Gr. μετὰ ?) (W., p. 25, l. 15).

من See مربع and مركب.

ممتنع Impossible (W., p. 55, l. 11).

تمييز Distinction (W., p. 26, l. 10). Greek, H., Vol. V, p. 551, l. 24, διάκρισις.

ن

انزل To take (e. g., Let us take three rational lines commensurable in square only, W., p. 22, l. 2).

نسبة Proportion, ratio (W., p. 5, l. 1; p. 6, l. 6ff.; p. 8, l. 14ff.). Greek, λόγος.

نسبة الضعفين The ratio of 2 to 1 (W., p. 7, l. 14).

نسبة الثلثة الاضعاف The ratio of 3 to 1 (W., p. 7, l. 14).

على نسبة In [continued] proportion (W., p. 21, l. 17).

على نسبة ذات وسط وطرفين	(In extreme and mean ratio).
خط على نسبة فى التناسب الهندسى	In proportion. The whole phrase means, "The geometric mean" (W., p. 45, ll. 4—5).
خط على نسبة فى التناسب التاليفى	The harmonic mean (W., p. 45, ll. 5—6.
فى النسبة	In mean proportion between (W., p. 20, l. 6).
النسبة الهندسية	Geometrical proportion (W., p. 19, l. 4). Greek, H., Vol. V, p. 488, l. 23, τὴν γεωμετρικὴν ἀναλογίαν.
تناسب	Proportion, ratio (the abstract idea of) (W., p. 7, l. 1; p. 9, l. 4). Continued proportion (W., p. 23, l. 7).
التناسب الهندسى	Geometrical proportion (W., p. 45, l. 5).
التناسب العددى	Arithmetical proportion (W., p. 45, l. 17).
التناسب التاليفى	Harmonic proportion (W., p. 45, l. 6).
خط على التناسب العددى	The Arithmetical mean (W., p. 45, ll. 15—16).
مناسب	Proportional (to something) (W., p. 45, l. 12; p. 20, l. 13).
مناسبة هندسية	Geometrical proportion (W., p. 45, l. 12).
خط مناسب مناسبة هندسية	The geometric mean (W., p. 45, l. 12).
متناسب	Proportional (To one-another) (T., Book X, p. 231).
نصف دائرة	Semi-circle (W., p. 50, l. 3).
عدم النطق	Irrationality (W., p. 14, l. 9).
منطق	Rational (W., p. 1, l. 2 etc.). Greek, ῥητόν. See صم , متصل , موسط , قوى .
منطقة فى الطول وفى القوة	Rational lines commensurable in length and square (W., p. 5, ll. 6, 8, 9, 10, 11). See Translation, Part I, note 22.
غير منطق	Irrational (W., p. 63, ll. 13—14).
نظيرة — نظائر	Like or contrary (W., p. 39, l. 19; p. 40, l. 2; p. 54, ll. 17, 20). See Translation, Part II, note 71.
نظام	Standard (of measurement or judgment) (W., p. 2, l. 16). Classification (of the irrationals) (W., p. 29, l. 1).
منتظم	Ordered (of irrationals) (W., p. 2, l. 7; p. 29, l. 5).
غير منتظم	Unordered (of irrationals) (W., p. 2, l. 7, p. 29, l. 6).

نقص (With Acc. & من) To subtract something from (W., p. 40, l. 11).

تنقيص Subtraction (of lines in the case of the irrationals formed by subtraction) (W., p. 23, l. 6).

تنقّص Reduction, bisection (W., p. 4, l. 15).

منقوص Subtracted from (e. g., the areas subtracted from) (W., p. 40, l. 11).

نقطة A point (W., p. 50, l. 9).

النهاية The finite (W., p. 3, l. 15). Greek, τὸ πέρας.

ما لا نهاية The infinite, infinity (W., p. 3, ll. 15, 17, 19; p. 4, ll. 1, 3) Greek, τὸ ἄπειρον.

ذوات نهاية Finite (W., p. 3, l. 16).

بلا نهاية Infinite (W., p. 4, l. 2).

الى غير نهاية Ad infinitum or indefinitely (W., p. 3, ll. 7, 8).

الى ما لا نهاية Ad infinitum or indefinitely (W., p. 4, l. 16).

التناهى Finitude, the finite (W., p. 3, ll. 18, 21).

متناهى Finite, determined (of magnitudes) (W., p. 3, l. 8; p. 7, l. 2ff.) Greek, H., Vol. V, p. 418, l. 7, πεπερασμένος.

Defined (of plurality or multitude) (W., p. 8, l. 17, N. 5). Greek, ὡρισμένος (πεπερασμένος). See Translation, Part I, note 44.

ه

هناك "There", the ideal world (W., p. 14, ll. 3, 8). Greek, τὸ ἐκεῖ.

الهيولى المحسوسة Sensible matter (W., p. 14, l. 1). Greek, ὕλη αἰσθητή. See Translation, Part I, note 104.

الهيولى المعقولة Intelligible matter (W., p. 14, ll. 1, 3). Greek, ὕλη νοητή. See Translation, Part I, note 104.

و

وتّر To subtend (of a line an angle) (W., p. 51, l. 4).

وتر Diameter, chord (of a circle) (Spr., Vol. II, p. 1471).

واجب ضرورة Necessary, Self-evident (W., p. 55, ll. 6—7, 19).

الوحدة Unity (W., p. 3, l. 10). It is the opposite of الكثرة (Plurality).

الواحد One (as the principle of the numbers) (W., p. 4, l. 4).

متوازى الاضلاع	A rectangular parallelogram (W., p. 50, l. 11).
وسيطة — وسائط	The means (geometric, arithmetical, harmonic) (W., p. 2, l. 2).
الموسط, الخطّ الموسط Pl. الموسطات الموسطة	The medial line (W., p. 5, ll. 7, 8, 9, 11—12; p. 19, ll. 5, 12, 16). Greek, H., Vol. V, p. 488, l. 21, ἡ μέση.
موسطة فى الطول والقوة	Medial lines commensurable in length and square) (W., p. 5, ll. 8—9, 11). The full phrase, موسطان مشتركان فى الطول (فى القوة) is given, p. 19, ll. 17—18; p. 20, ll. 1, 3.
الذى من موسطين الاول	The first bimedial (W., p. 39, l. 14).
التى من موسطين الاوائل	First bimedials (W., p. 57, ll. 19—20).
من موسطين الاول	The first bimedial (W., p. 22, l. 10; p. 36, l. 5).
الذى من موسطين الثانى	The second bimedial (W., p. 39, l. 15).
التى من موسطين الثوانى	Second bimedials (W., p. 57, ll. 19—20).
من موسطين الثانى	The second bimedial (W., p. 36, l. 6).
الذى من ثلثة موسطات الاول	The first trimedial (W., p. 21, ll. 19—20).
الذى من ثلثة موسطات الثانى	The second trimedial (W., p. 21, ll. 19—20).
الذى يجعل الكل موسطا مع منطق	The line which produces with a rational area a medial whole (W., p. 22, l. 17; p. 26, l. 17; p. 44, l. 2).
الذى يجعل الكل موسطا مع موسط (مع الموسط)	The line which produces with a medial area a medial whole (W., p. 22, ll. 17—18; p. 26, l. 18; p. 44, l. 5).
موسط على التناسب العددى	The arithmetical mean (W., p. 45, l. 15; p. 46, ll. 14—15).
موسط تاليفى	The harmonic mean (W., p. 49, l. 5).
الخطّ الاوسط	The medial line (W., p. 23, l. 19). Greek, H., Vol. V, p. 484, L. 14, τῆς μέσης.

التوسطات (Sing. توسط) The means (W., p. 9, l. 9) (geometrical, arithmetical, harmonic).

التوسط الهندسى The geometric mean (W., p. 45, l. 7).

التوسط العددى The arithmetical mean (W., p. 45, l. 8).

التوسط التاليفى The harmonic mean (W., p. 45, l. 9).

متوسط A mean proportional (W., p. 19, ll. 5, 9; p. 21, l. 15).

متوسط فى النسبة A mean proportional (W., p. 21, l. 5; p. 24, l. 3).

متوسط على التناسب العددى The arithmetical mean (W., p. 46, l. 16, l. 19).

متّصل Continuous (of quantity) (W., p. 3, l. 14). It is the opposite of منفصل.

المتّصل بالمنطق يصير الكل موسطا That which produces with a rational area a medial whole (T., Book X, p. 287).

المتّصل بموسط يصير الكل موسطا That which produces with a medial area a medial whole (T., Book X, p. 288).

وضع خطّين متّصلين على استقامة To put two lines in a straight line (W., p. 59, L. 9).

وضع (With Acc. & على) To assign something to something (W., p. 19, l. 7). Greek, H., Vol. V, p. 485, l. 9, ἔθετο ..... ἐπί.

وضع To posit, i. e., assume for the purposes of proof. (W., p. 16, l. 2).

بالوضع By convention (W., p. 6, l. 13; p. 14, ll. 14, 15). It is the opposite of بالطبع. Greek, H., Vol. V, p. 414, l. 4. θέσει.

وضع Hypothesis (W., p. 13, l. 6). Greek, ὑπόθεσις. The reference is to the first hypothesis of *Parmenides*, 140b. c. d. Cf. 136 for ὑπόθεσις.

موضع Area, rectangle (W., p. 16, ll. 9, 15, 18; p. 18, l. 16ff.; p. 19, ll. 6, 7, 9, 10). It is practically synonymous with سطح. See the glosses to p. 16, ll. 9, 15, 18. l. 13 سطح is used for موضع.
As "rectangle" it represents the phrase, موضع قائم الزوايا. (Cf. p. 30, l. 19). Greek, H., Vol. V, p. 484, l. 13, χωρίον τό.

اوطأ To establish (W., p. 30, l. 19). See Translation, Part II, note 12.

الوقوف Rest (W., p. 3, l. 18). It is the opposite of الحركة (Movement).

تولّد To be produced (of areas, for example, by rational lines, i. e., to be contained by them) (W., p. 39, l. 3).

ى

يقينيّ Certain, exact (of a method) (W., p. 4, l. 12; p. 1, l. 7).
